My name is Subhashish Chattopadhyay. I have been teaching for IIT-JEE, Various International Exams (such as IMO [International Mathematics Olympiad], IPhO [International Physics Olympiad], IChO [International Chemistry Olympiad]), IGCSE (IB), CBSE, I.Sc, Indian State Board exams such as WB-Board, Karnataka PU-II etc since 1989. As I write this book in 2016, it is my 25th year of teaching. I was a Visiting Professor to BARC Mankhurd, Chembur, Mumbai, Homi Bhabha Centre for Science Education (HBCSE) Physics Olympics camp BARC Campus.
The selection for National Camp (for Official Science Olympiads - Physics, Chemistry, Biology, Astronomy) happens in the following steps....

1) NSEP (National Standard Exam in Physics) and NSEC (National Standard Exam in Chemistry) held around 24th November. Approx 35,000 students appear for these exams every year. The exam fees is Rs 100 each. Since 1998 the IIT JEE toppers have been topping these exams and they get to know their rank / performance ahead of others.

2) INPhO (Indian National Physics Olympiad) and INChO (Indian National Chemistry Olympiad). Around 300 students in each subject are allowed to take these exams. Students coming from outside cities are paid fair from the Govt of India.

3) The Top 35 students of each subject are invited at HBCSE (Homi Bhabha Center for Science Education) Mankhurd, near Chembur, BARC, Mumbai. After a 2-3 weeks camp the top 5 are selected to represent India. The flight tickets and many other expenses are taken care by Govt of India.
Since last 50 years there has been no dearth of “Good Books“. Those who are interested in studies have been always doing well. This e-Book does not intend to replace any standard text book. These topics are very old and already standardized.

There are 3 kinds of Text Books

- The thin Books - Good students who want more details are not happy with these. Average students who need more examples are not happy with these. Most students who want to “Cram” quickly and pass somehow find the thin books “good” as they have to read less !

- The Thick Books - Most students do not like these, as they want to read as less as possible. Average students are “busy” with many other things and have no time to read all these.

- The Average sized Books - Good students do not get all details in any one book. Most bad students do not want to read books of “this much thickness“ also !

We know there can be no shoe that’s fits in all.

Printed books are not e-Books! Can’t be downloaded and kept in hard-disc for reading “later” ........

So if you read this book later, you will get all kinds of examples in a single place. This becomes a very good “Reference Material”. I sincerely wish that all find this “very useful”.

Students who do not practice lots of problems, do not do well. The rules of “doing well” had never changed .... Will never change !
After 2016 CBSE Mathematics exam, lots of students complained that the paper was tough!

CBSE assures remedial measures for tricky and tough Class XII Math paper

After several students claimed that the Central Board of Secondary Education (CBSE) Class XII board Mathematics examination paper was 'tricky' and tough, the board has issued a clarification on remedial measures which are likely to be taken before evaluation.

The CBSE says that feedback received from various stakeholders like students, subject teachers and examiners will be put before the committee of subject experts.
In 2015 also the same complain was there by many students

New Delhi: A senior Congress member on Thursday raised the issue of the tough mathematics question paper in the ongoing CBSE board examinations and asked the government to consider the issue “seriously”.
In March 2016, students of Karnataka PU-II also complained the same, regarding standard 12 (PU-II Mathematics Exam). Even though the Math Paper was identical to previous year, most students had not even solved the 2015 Question Paper.

These complain are not new. In fact since last 40 years, (since my childhood), I always see this; every year the same setback, same complain!

In this e-Book I am trying to solve this problem. Those students who practice can learn.

No one can help those who are not studying, or practicing.

Learn more at http://skmclasses.weebly.com/iit-jee-home-tuitions-bangalore.html
A very polite request:
I wish these e-Books are read only by Boys and Men. Girls and Women, better read something else; learn from somewhere else.
Preface

We all know that in the species “Homo Sapiens”, males are bigger than females. The reasons are explained in standard 10, or 11 (high school) Biology texts. This shapes or size, influences all of our culture. Before we recall / understand the reasons once again, let us see some random examples of the influence.

Random - 1

If there is a Road rage, then who all fight? (generally?). Imagine two cars driven by adult drivers. Each car has a woman of similar age as that of the Man. The cars “touch” or “some issue happens”. Who all comes out and fights? Who all are most probable to drive the cars?

( Men are eager to fight, eager to rule, eager for war. Men want to drive. Men want to win )

Random - 2

Heavy metal music artists are all Men. Metallica, Black Sabbath, Motley Crue, Megadeth, Motorhead, AC/DC, Deep Purple, Slayer, Guns & Roses, Led Zeppelin, Aerosmith ….. the list can be in thousands. All these are grown-up Boys, known as Men.

( Men strive for perfection. Men are eager to excel. Men work hard. Men want to win. )

Random - 3

Apart from Marie Curie, only one more woman got Nobel Prize in Physics. ( Maria Goeppert Mayer - 1963 ). So, … almost all are men.

Random - 4

The best Tabla Players are all Men.

Boys start fighting from school days. Girls do not fight like this.
Random - 6

The highest award in Mathematics, the “Fields Medal” is around since decades. Till date only one woman could get that. (Maryam Mirzakhani - 2014). So, ... almost all are men.

Random - 7

Actor is a gender neutral word. Could the movie like “Top Gun” be made with Female actors? The best pilots, astronauts, Fighters are all Men.
In my childhood had seen a movie named “The Tower in Inferno“. In the movie when the tall tower is in fire, women were being saved first, as only one lift was working....

Many decades later another movie is made. A box office hit. “The Titanic“. In this also .... As the ship is sinking women are being saved. **Men are disposable.** Men may get their turn later...

Movies are not training programs. Movies do not teach people what to do, or not to do. Movies only reflect the prevalent culture. Men are disposable, is the culture in the society. Knowingly, unknowingly, the culture is
depicted in Movies, Theaters, Stories, Poems, Rituals, etc. I or you can’t write a story, or make a movie in which after a minor car accident the Male passengers keep seating in the back seat, while the both the women drivers come out of the car and start fighting very bitterly on the road. There has been no story in this world, or no movie made, where after an accident or calamity, Men are being helped for safety first, and women are told to wait.

Random - 9

Artists generally follow the prevalent culture of the Society. In paintings, sculptures, stories, poems, movies, cartoon, Caricatures, knowingly / unknowingly, “the prevalent Reality” is depicted. The opposite will not go well with people. If deliberately “the opposite” is shown then it may only become a special art, considered as a special mockery.

Random - 10

Men go to “girl / woman’s house” to marry / win, and bring her to his home. That is a sort of winning her. When a boy gets a “Girl-Friend “, generally he and his friends consider that as an achievement. The boy who “got / won “a girl-friend feels proud. His male friends feel, jealous, competitive and envious. Millions of stories have been written on these themes. Lakhs of movies show this. Boys / Men go for “bike race “, or say “ Car Race “, where the winner “gets “the most beautiful girl of the college.

( Men want to excel. Men are eager to fight, eager to rule, eager for war. Men want to drive. Men want to win. )

Prithviraj Chauhan “ went ` to “ pickup “ or “ abduct “ or “ win “ or “ bring “ his love. There was a Hindi movie (hit) song “ Pasand ho jaye, to ghar se utta laye “. It is not other way round. Girls do not go to Boy’s house or man’s house to marry. Nor the girls go in a gang to “pick-up “ the boy / man and bring him to their home / place / den.

Random - 11

Rich people; often are very hard working. Successful business men, establish their business (empire), amass lot of wealth, with lot of difficulty. Lots of sacrifice, lots of hard work, gets into this. Rich people’s wives had no contribution in this wealth creation. Women are smart, and successful upto the extent to choose the right/rich
man to marry. So generally what happens in case of Divorces? Search the net on “most costly divorces“ and you will know. The women (who had no contribution at all, in setting up the business / empire) often gets in Billions, or several Millions in divorce settlements.

Ted Danson & Casey Coates -- $30 million

Ted Danson’s claim to fame is undoubtedly his decade-long stint as Sam Malone on NBC’s celebrated sitcom Cheers. While he did other TV shows and movies, he will always be known as the bartender of that place where everybody knows your name. He met his future first bride Casey, a designer, in 1976 while doing Erhard Seminars Training.

Ten years his senior, she suffered a paralyzing stroke while giving birth to their first child in 1979. In order to nurse her back to health, Danson took a break from acting for six months. But after two children and 18 years of marriage, the infatuation fell to pieces. Danson had started seeing Whoopi Goldberg while filming the comedy. Made in America and this precipitated the 1992 divorce. Casey got $30 million for her trouble.

It was Boys and Men, who brought the girls / women home. The Laws are biased, completely favoring women. The men are paying for their own mistakes.

See [https://zookeepersblog.wordpress.com/biased-laws/](https://zookeepersblog.wordpress.wordpress.com/biased-laws/)

( Man brings the Woman home. When she leaves, takes away her share of big fortune! )

Random - 12

A standardized test of Intelligence will never be possible. It never happened before, nor ever will happen in future; where the IQ test results will be acceptable by all. In the net there are thousands of charts which show that the intelligence scores of girls / women are lesser. Debates of Trillion words, does not improve performance of Girls.

I am not wasting a single second debating or discussing with anyone, on this. I am simply accepting ALL the results. IQ is only one of the variables which is required for success in life. Thousands of books have been written on “Networking Skills “, EQ (Emotional Quotient ), Drive, Dedication, Focus, “ Tenacity towards the end goal “ ... etc. In each criteria, and in all together, women ( in general ) do far worse than men. Bangalore is known as “ ..... capital of India “. [ Fill in the blanks ]. The blanks are generally filled as “ Software Capital “, “ IT Capital “, “ Startup Capital “, etc. I am member in several startup eco-systems / groups. I have attended hundreds of
meetings, regarding “technology startups“, or “idea startups“. These meetings have very few women. Starting up new companies are all “Men’s Game“ / “Men’s business“. Only in Divorce settlements women will take their goodies, due to Biased laws. There is no dedication, towards wealth creation, by women.

Random - 13

Many men, as fathers, very unfortunately treat their daughters as “Princess“. Every “non-performing“ woman / wife was “princess daughter“ of some loving father. Pampering the girls, in name of “equal opportunity“, or “women empowerment“, have led to nothing.

![Image](image.jpg)

"Please turn it down - Daddy is trying to do your homework."

There can be thousands of more such random examples, where “Bigger Shape / size“ of males have influenced our culture, our Society. Let us recall the reasons, that we already learned in standard 10 - 11, Biology text Books. In humans, women have a long gestation period, and also spends many years (almost a decade) to grow, nourish, and stabilize the child. (Million years of habit) Due to survival instinct Males want to inseminate. Boys and Men fight for the “facility (of womb + care)“ the girl / woman may provide. Bigger size for males, has a winning advantage. Whoever wins, gets the “woman / facility“. The male who is of “Bigger Size“, has an advantage to win... Leading to Natural selection over millions of years. In general “Bigger Males“; the “fighting instinct“ in men; have led to wars, and solving tough problems (Mathematics, Physics, Technology, startups of new businesses, Wealth creation, Unreasonable attempts to make things [such as planes], Hard work ....)

So let us see the IIT-JEE results of girls. Statistics of several years show that there are around 17, (or less than 20) girls in top 1000 ranks, at all India level. Some people will yet not understand the performance, till it is said that ... year after year we have around 980 boys in top 1000 ranks. Generally we see only 4 to 5 girls in top 500. In last 50 years not once any girl topped in IIT-JEE advanced. Forget about Single digit ranks, double digit ranks by girls have been extremely rare. It is all about “good boys“, “hard working“, “focused“, “Bel-esprit“ boys.

In 2015, Only 2.6% of total candidates who qualified are girls (upto around 12,000 rank). while 20% of the Boys, amongst all candidates qualified. The Total number of students who appeared for the exam were around 1.4 million for IIT-JEE main. Subsequently 1.2 lakh (around 120 thousands) appeared for IIT-JEE advanced.

IIT-JEE results and analysis, of many years is given at https://zookeepersblog.wordpress.com/iit-jee-iseet-main-and-advanced-results/

In Bangalore it is rare to see a girl with rank better than 1000 in IIT-JEE advanced. We hardly see 6-7 boys with rank better than 1000. Hardly 2-3 boys get a rank better than 500.

See http://skmclasses.weebly.com/everybody-knows-so-you-should-also-know.html

Professor Subhashish Chattopadhyay
Recall the various tricks, formulae, and rules of solving Indefinite Integrals

(i) $\int \frac{1}{x^2 + a^2} \, dx = \frac{1}{a} \tan^{-1} \frac{x}{a} + C$

(ii) $\int \frac{1}{a^2 - x^2} \, dx = \frac{1}{2a} \log \left| \frac{a + x}{a - x} \right| + C = \frac{1}{a} \tanh^{-1} \left( \frac{x}{a} \right) + C$

(iii) $\int \frac{dx}{x^2 - a^2} = \frac{1}{2a} \log \left| \frac{x - a}{x + a} \right| + C = -\frac{1}{a} \coth^{-1} \left( \frac{x}{a} \right) + C$

(iv) $\int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1} \frac{x}{a} + C$

(v) $\int \frac{dx}{\sqrt{x^2 - a^2}} = \log \left| x + \sqrt{x^2 - a^2} \right| + C = \cosh^{-1} \left( \frac{x}{a} \right) + C$

(vi) $\int \frac{dx}{\sqrt{x^2 + a^2}} = \log \left| x + \sqrt{x^2 + a^2} \right| + C = \sinh^{-1} \left( \frac{x}{a} \right) + C$

(vii) $\int x^2 + a^2 \, dx = \frac{1}{2} \left[ x \sqrt{x^2 + a^2} + a^2 \log \left| x + \sqrt{x^2 + a^2} \right| \right] + C$

(viii) $\int \sqrt{a^2 - x^2} \, dx = \frac{1}{2} \left[ x \sqrt{a^2 - x^2} + a^2 \sin^{-1} \left( \frac{x}{a} \right) \right] + C$

(ix) $\int x^2 - a^2 \, dx = \frac{1}{2} \left[ x \sqrt{x^2 - a^2} - a^2 \log \left| x + \sqrt{x^2 - a^2} \right| \right] + C$

(x) $\int (px + q) \sqrt{ax^2 + bx + c} \, dx = \frac{p}{2a} \int (2ax + b) \sqrt{ax^2 + bx + c} \, dx$

\[ + \frac{q - pb}{2a} \int \sqrt{ax^2 + bx + c} \, dx \]
\[ \int e^{ax} dx = \frac{1}{a} e^{ax} \]
\[ \int e^{ax} \cos bx dx = \frac{e^{ax}}{a^2 + b^2} (a \cos bx + b \sin bx) \]
\[ \int e^{ax} \sin bx dx = \frac{e^{ax}}{a^2 + b^2} (a \sin bx - b \cos bx) \]
\[ \int a^x dx = \frac{a^x}{\ln a} + c \]
\[ \int \log x dx = x (\log x - 1) + c \]
\[ \int \frac{1}{x} dx = \log |x| + c \]
\[ \int a^x dx = a^x \log a + c \]
\[ \int \frac{dx}{a^x + a} = \frac{1}{\ln a} \log \frac{a + x}{a} + c \]
\[ \int \frac{dx}{a^x - a} = \frac{1}{\ln a} \log \frac{x - a}{x + a} + c \]
\[ \int \csc x \cot x dx = -\csc x + c \]
\[ \int \csc^2 x dx = -\cot x + c \]
\[ \int \sec x \tan x dx = \sec x + c \]
\[ \int \sec^2 x dx = \tan x + c \]
\[ \int \sin x dx = -\cos x + c \]
\[ \int \cos x dx = \sin x + c \]
\[ \int (ax + b)^n dx = \frac{(ax + b)^{n+1}}{a(n+1)} + C, \text{ for } n \neq -1 \]
\[ \int \frac{dx}{ax + b} = \frac{1}{a} \log |ax + b| + C \]
\[ \int e^{ax+b} dx = \frac{1}{a} e^{ax+b} + C \]
\[ \int \cos(ax + b) dx = \frac{1}{a} \sin(ax + b) + C \]
\[ \int \sec^2(ax + b) dx = \frac{1}{a} \tan(ax + b) + C \]
\[ \int \csc^2(ax + b) dx = \frac{1}{a} \cot(ax + b) + C \]
\[ \int \csc(ax + b) \cot(ax + b) dx = \frac{1}{a} \csc(ax + b) + C \]
Some advanced procedures....

\[ \int \frac{x^m}{(a + bx)^p} \, dx \]
\[ m \text{ is } a + \text{ve integer} \]

\[ \int \frac{dx}{x^n (a + bx)^p}, \]
\[ \text{Put } a + bx = z \]

where either \((m \text{ and } p \text{ positive integers})\) or \((m \text{ and } p \text{ are fractions, but } m + p = \text{ integers} > 1)\)

\[ \int x^n (a + bx)^m \, dx, \]
\[ m, n, p \text{ are rationals.} \]

(i) \(p \text{ is } a + \text{ve integer}\)
\[ \text{Apply Binomial theorem to } (a + bx)^p \]
\[ \text{Put } x = z^k \text{ where } k = \text{common denominator of } m \text{ and } n. \]

(ii) \(p \text{ is } a - \text{ve integer}\)
\[ \text{Put } (a + bx)^{-p} = z^k \text{ where } k = \text{denominator of } p. \]

(iii) \(\frac{m + 1}{n}\) is an integer
\[ \text{Put } a + bx^n = x^\alpha z^\beta \]
\[ \text{where } k = \text{denominator of fraction } \frac{m}{n}. \]

\[ \int \frac{x^2 \, dx}{x^4 + k x^2 + a^4} = \frac{1}{2} \int \frac{(x^2 + a^2) \, dx}{x^4 + k x^2 + a^4} + \frac{1}{2} \int \frac{(x^2 - a^2) \, dx}{x^4 + k x^2 + a^4} \]
\[ \int \frac{dx}{(x^4 + k x^2 + a^4)} = \frac{1}{2 a^2} \int \frac{(x^2 + a^2) \, dx}{x^4 + k x^2 + a^4} - \frac{1}{2 a^2} \int \frac{(x^2 - a^2) \, dx}{x^4 + k x^2 + a^4} \]
\[ \int \frac{dx}{(x^2 + k)^n} = \frac{x}{k (2n - 2) (x^2 + k)^{n-1}} + \frac{(2n - 3)}{k (2n - 2)} \int \frac{dx}{(x^2 + k)^{n-1}} \]

\[ \int \frac{dx}{(Ax^2 + Bx + C) \sqrt{(ax^2 + bx + c)}} \]
\[ \text{we need to substitute } \frac{ax^2 + bx + c}{Ax^2 + Bx + C} = t \]
Every student knows that the last step is...

\[ \int_{a}^{b} f(x) \, dx = \left[ F(x) \right]_{a}^{b} = F(b) - F(a) \]

Definite Integrals have to be solved by (more than) 14 different ways, depending on the type of problem.

**Type 1 - Here no property, specific to Definite Integrals is used.**

The integration is solved completely as Indefinite. Finally the Upper and Lower limits are substituted.

**Example - 1.1 -**

\[ \int_{0}^{\pi} \frac{1}{1 + \sin x} \, dx \]

If we need to solve

\[ \int \frac{1}{1 + \sin x} \, dx \]

we should know how to integrate \( \) (Indefinite Integral)

In the solution, notice that no special or specific property of Definite Integral is being used.
Similarly example - 1.2 -

\[ \int_{0}^{\pi} \log x \, dx = \left[ x \log x - x \right]_{0}^{\pi} \]

As we know from indefinite integrals that Integration of \( \ln |x| \) is \( x \ln |x| - x \)

If we substitute the upper limit we get \( 2 \ln 2 - 2 \)

And substituting the lower limit we get \( 1 \ln 1 - 1 = -1 \)

So final result is \( 2 \ln 2 - 2 \cdot ( -1 ) = 2 \ln 2 - 1 \)

Example - 1.3 -

If we need to integrate by parts then do not apply the limits at intermediate steps.

Solve the whole problem as indefinite and then finally apply the limits

\[ \int uv \, dx = u \int v \, dx - \int \left( u' \int v \, dx \right) \, dx. \]
So to solve \( \int_0^1 (x^2 + 1) e^{-x} \, dx \) we proceed as above equation

Let \( u = x^2 + 1 \) and \( dv = e^{-x} \, dx \). Then \( du = 2x \, dx \) and \( v = -e^{-x} \)

\[
I = \int_0^1 (x^2 + 1) e^{-x} \, dx = [-e^{-x}(x^2 + 1)]_0^1 + 2 \int_0^1 xe^{-x} \, dx
\]

\[
\int_0^1 xe^{-x} \, dx = [-xe^{-x}]_0^1 + \int_0^1 e^{-x} \, dx = [-e^{-x}(x + 1)]_0^1
\]

Thus finally the required Solution is

\[
\int_0^1 (x^2 + 1) e^{-x} \, dx = [-e^{-x}(x^2 + 2x + 3)]_0^1 = -6e^{-1} + 3
\]

**Example - 1.4 -**

\[
\frac{1}{2} \int_0^1 x \tan^{-1} x \, dx = \frac{\pi}{4} - \frac{1}{2}
\]

Show that

\[
\frac{1}{2} \int_0^1 x \tan^{-1} x \, dx = \tan^{-1} x \int_0^1 x \, dx - \frac{1}{2} \left( \int_0^1 x \, dx \right) \frac{d}{dx} \left( \tan^{-1} x \right) \, dx
\]

\[
= \left[ \frac{x^2}{2} \tan^{-1} x \right]_0^1 - \frac{1}{2} \left( \frac{x^2}{1 + x^2} \right) \, dx
\]

\[
= \left[ \frac{x^2}{2} \tan^{-1} x \right]_0^1 - \frac{1}{2} \left( \frac{1 + x^2 - 1}{1 + x^2} \right) \, dx
\]

\[
= \frac{1}{2} \left( \frac{\pi}{4} \right) - \frac{1}{2} \left[ \int_0^1 \frac{dx}{1 + x^2} - \frac{1}{0} \int_0^1 \frac{dx}{1 + x^2} \right]
\]

\[
= \frac{\pi}{8} - \frac{1}{2} \left[ 1 - \tan^{-1} x \right]_0^1
\]

\[
= \frac{\pi}{8} - \frac{1}{2} \left[ 1 - \frac{\pi}{4} \right]
\]

\[
= \frac{\pi}{8} - \frac{1}{2} + \frac{\pi}{8}
\]

\[
= \frac{\pi}{4} - \frac{1}{2}
\]
Example - 1.5 -

Solve \( \int_{0}^{\sqrt{2}} x \sqrt{x+2} \, dx \)

Put \( x + 2 = t^2 \) so \( dx = 2t \, dt \) at \( x = 0 \) \( t = \sqrt{2} \) at \( x = 2 \) \( x + 2 = 4 = t^2 \Rightarrow t = 2 \)

\[
I = \int_{\sqrt{2}}^{2} (t^2 - 2) \sqrt{2} \, 2t \, dt
= 2 \int_{\sqrt{2}}^{2} (t^2 - 2) \, 2t \, dt
= 2 \int_{\sqrt{2}}^{2} (t^4 - 2t^2) \, dt
= 2 \left[ \frac{t^5}{5} - \frac{2t^3}{3} \right]_{\sqrt{2}}^{2}
= 2 \left[ \frac{32}{5} - \frac{16}{3} - \frac{4\sqrt{2}}{5} + \frac{4\sqrt{2}}{3} \right]
= \frac{16}{15}(2 + \sqrt{2})
= \frac{16\sqrt{2}(\sqrt{2} + 1)}{15}
\]

Example - 1.6 -

Solve \( \int_{\frac{1}{3}}^{1} \frac{x - x^3}{x^4} \, dx \)

Let \( x = \sin \theta \) \( \Rightarrow dx = \cos \theta \, d\theta \)

When \( x = \frac{1}{3} \), \( \theta = \sin^{-1} \left( \frac{1}{3} \right) \) and when \( x = 1 \), \( \theta = \frac{\pi}{2} \)

\[
\Rightarrow I = \int_{\sin^{-1} \left( \frac{1}{3} \right)}^{\pi/2} \frac{(\sin \theta - \sin^3 \theta)^{\frac{1}{3}}}{\sin^4 \theta} \cos \theta \, d\theta
= \int_{\sin^{-1} \left( \frac{1}{3} \right)}^{\pi/2} \frac{\sin \theta^{\frac{1}{3}} (1 - \sin^2 \theta)^{\frac{1}{3}}}{\sin^4 \theta} \cos \theta \, d\theta
= \int_{\sin^{-1} \left( \frac{1}{3} \right)}^{\pi/2} \frac{\sin \theta^{\frac{1}{3}} (\cos^2 \theta)^{\frac{1}{3}}}{\sin^4 \theta} \cos \theta \, d\theta
= \int_{\sin^{-1} \left( \frac{1}{3} \right)}^{\pi/2} \frac{(\cos \theta)^{\frac{1}{3}} \csc^2 \theta}{\sin^2 \theta} d\theta
= \int_{\sin^{-1} \left( \frac{1}{3} \right)}^{\pi/2} \frac{(\cos \theta)^{\frac{1}{3}} \csc^2 \theta}{\sin^2 \theta} d\theta
\]

Let \( \cot \theta = t \Rightarrow -\csc \theta \, d\theta = dt \)

When \( \theta = \sin^{-1} \left( \frac{1}{3} \right) \), \( t = 2\sqrt{2} \) and when \( \theta = \frac{\pi}{2} \), \( t = 0 \)

\[
\therefore I = -\int_{2\sqrt{2}}^{0} (t^5) \, dt
= -\left[ \frac{3}{8} t^{\frac{8}{3}} \right]_{2\sqrt{2}}^{0}
= \frac{3}{8} \left( \frac{8}{3} \right)^{\frac{8}{3}}
= -\frac{3}{8} \left( 2\sqrt{2} \right)^{\frac{8}{3}}
\]

AIEEE (now known as IIT-JEE main) - 2004

Solve

\[ \int_{0}^{\pi/2} \frac{(\sin x + \cos x)^2}{\sqrt{(\sin x + \cos x)^2}} \, dx \]

\[ = \int_{0}^{\pi/2} (\sin x + \cos x) \, dx \]

The value of \( I = \int_{0}^{\pi/2} \frac{(\sin x + \cos x)^2}{\sqrt{1 + \sin 2x}} \, dx \) is

(a) 2  (b) 1  (c) 0  (d) 3

AIEEE (now known as IIT-JEE main) - 2007

The solution for \( x \) of the equation \( \int_{\sqrt{2}}^{x} \frac{dt}{t \sqrt{t^2 - 1}} = \frac{\pi}{2} \) is

(a) \( \frac{\sqrt{3}}{2} \)  (b) \( 2\sqrt{2} \)  (c) 2  (d) \( \pi \)

Solution:

\[ \left[ \sec^{-1} t \right]_{\sqrt{2}}^{x} = \frac{\pi}{2} \]

\[ \sec^{-1} x - \sec^{-1} \sqrt{2} = \frac{\pi}{2} \Rightarrow \sec^{-1} x = \frac{\pi}{2} + \frac{\pi}{4} = \frac{3\pi}{4} \]

\( x = -\sqrt{2} \)  There is no correct option.
Example - 1.7 -

How to Shift limits in Definite Integrals, when variable is changed is explained at

https://archive.org/details/ShiftingOfLimitsInDefiniteIntegralStepsDiscussed1
Type 2 - Here special properties of Definite Integrals are used

Let us see the list of properties

\[
\begin{align*}
\int_{a}^{b} f(x)\,dx &= \int_{a}^{b} f(t)\,dt \\
\int_{a}^{b} f(x)\,dx &= -\int_{b}^{a} f(x)\,dx. \text{ In particular, } \int_{a}^{a} f(x)\,dx = 0 \\
\int_{a}^{b} f(x)\,dx &= \int_{a}^{c} f(x)\,dx + \int_{c}^{b} f(x)\,dx \\
\int_{a}^{b} f(x)\,dx &= \int_{a}^{b} f(a+b-x)\,dx \\
\int_{0}^{a} f(x)\,dx &= \int_{a}^{b} f(a-x)\,dx \\
\int_{0}^{2a} f(x)\,dx &= \int_{0}^{a} f(x)\,dx + \int_{0}^{a} f(2a-x)\,dx \\
\int_{0}^{2a} f(x)\,dx &= 2\int_{0}^{a} f(x)\,dx, \text{ if } f(2a-x) = f(x) \quad \text{and} \\
&\quad \quad 0 \text{ if } f(2a-x) = -f(x) \\
(i) \quad \int_{-a}^{a} f(x)\,dx &= 2\int_{0}^{a} f(x)\,dx, \text{ if } f \text{ is an even function, i.e., } f(-x) = f(x) \\
(ii) \quad \int_{-a}^{a} f(x)\,dx &= 0, \text{ if } f \text{ is an odd function, i.e., } f(-x) = -f(x).
\end{align*}
\]

The property of Modulus

\[\left| \int_{a}^{b} f(x)\,dx \right| < \int_{a}^{b} |f(x)|\,dx\]

An Example to start the discussion

The absolute value of

\[\int_{10}^{19} \frac{\sin x}{1 + x^8}\,dx \text{ is}\]
If the function $f(x)$ increases and has a concave graph in the interval $[a, b]$, then

$$(a - c) < \int_a^b f'(x) dx < (b - a) \frac{f(a) + f(b)}{2}$$

If the function $f(x)$ increases and has a convex graph in the interval $[a, b]$, then
Example - 2.1 - Solve \( \int^{\pi/2}_0 \cos^2 x \, dx \)

As indefinite integral when we solve this we express \( \cos^2 x \) as \( \cos 2x \) form

But with limits 0 to \( \pi/2 \) we better use

\[
I = \int^{\pi/2}_0 \cos^2 x \, dx - (1)
\]

\[
\Rightarrow I = \int^{\pi/2}_0 \cos^2 \left( \frac{\pi}{2} - x \right) \, dx
\]

\[
\Rightarrow I = \int^{\pi/2}_0 \sin^2 x \, dx - (2)
\]

Adding (1) and (2) we get

\[
2I = \int^{\pi/2}_0 (\sin^2 x + \cos^2 x) \, dx
\]

\[
\Rightarrow 2I = \int^{\pi/2}_0 1 \, dx
\]

\[
\Rightarrow 2I = \left[ x \right]^{\pi/2}_0
\]

\[
\Rightarrow 2I = \frac{\pi}{2}
\]

\[
\Rightarrow I = \frac{\pi}{4}
\]

Example - 2.2 - Is one of the most common questions, asked Lakhs of times in all sorts of school and entrance exams.

Find \( \int^{\pi/2}_0 \frac{\sqrt{\sin x}}{\sqrt{\sin x + \sqrt{\cos x}}} \, dx \)

Modification of this problem is to divide the Denominator by \( \sqrt{\sin x} \) bringing the numerator down (below Denominator). So the denominator becomes \( 1 + \sqrt{\cot x} \)
Also the problem could have been or without roots

\[ \int_{0}^{\pi} \frac{\cos x}{\sin x + \cos x} \, dx \]

Or

The approach to solve these remain the same

\[ \int_{0}^{\pi} \frac{\sqrt{\sin x}}{\sqrt{\sin x} + \sqrt{\cos x}} \, dx \quad \{1\} \]

Let \( I = \int_{0}^{\pi} \frac{\sqrt{\sin x}}{\sqrt{\sin x} + \sqrt{\cos x}} \, dx \)

\[ \Rightarrow I = \int_{0}^{\pi} \frac{\sqrt{\sin (\frac{\pi}{2} - x)}}{\sqrt{\sin (\frac{\pi}{2} - x)} + \sqrt{\cos (\frac{\pi}{2} - x)}} \, dx \]

\[ \Rightarrow I = \int_{0}^{\pi} \frac{\sqrt{\cos (\frac{\pi}{2} - x)}}{\sqrt{\cos (\frac{\pi}{2} - x)} + \sqrt{\sin x}} \, dx \quad \{2\} \]

Adding (1) and (2), we obtain

\[ 2I = \int_{0}^{\pi} \frac{\sqrt{\sin x} + \sqrt{\cos x}}{\sqrt{\sin x} + \sqrt{\cos x}} \, dx \]

\[ \Rightarrow 2I = \int_{0}^{\pi} 1 \, dx \]

\[ \Rightarrow 2I = [x]^{\pi}_{0} \]

\[ \Rightarrow 2I = \frac{\pi}{2} \]

\[ \Rightarrow I = \frac{\pi}{4} \]

**Example - 2.3** - Not only \( \sin x \) or \( \sqrt{\sin x} \) but \( \sin^{3/2} x \) or \( \sin^{5/2} x \) or \( \sin^{(2N+1)/2} x \)

meaning \( \cos x \) or \( \sin^{(\text{Odd Natural Number})/2} x \) will have the same approach
Let \( I = \int_0^\frac{\pi}{2} \frac{\sin^\frac{3}{2} x}{x + \cos^\frac{3}{2} x} \, dx \) \[ \text{[1]} \]

\[ \Rightarrow I = \int_0^\frac{\pi}{2} \frac{\sin^\frac{3}{2} \left( \frac{\pi}{2} - x \right)}{\sin^\frac{3}{2} \left( \frac{\pi}{2} - x \right) + \cos^\frac{3}{2} \left( \frac{\pi}{2} - x \right)} \, dx \]

\[ \Rightarrow I = \int_0^\frac{\pi}{2} \frac{\cos\frac{3}{2} x}{x + \cos^\frac{3}{2} x} \, dx \] \[ \text{[2]} \]

Adding [1] and [2], we obtain

\[ 2I = \int_0^\frac{\pi}{2} \frac{\sin^\frac{3}{2} x + \cos^\frac{3}{2} x}{\sin^\frac{3}{2} x + \cos^\frac{3}{2} x} \, dx \]

\[ 2I = \left[ x \right]_0^\frac{\pi}{2} \]

\[ 2I = \frac{\pi}{2} \]

\[ I = \frac{\pi}{4} \]

**Spoon feeding**
If \( I = \int_{\pi/6}^{\pi/3} \frac{dx}{1 + \sqrt{\tan x}} \), then \( I \) equals

\[
\begin{align*}
(a) & \quad \frac{\pi}{12} \\
(b) & \quad \frac{\pi}{6} \\
(c) & \quad \frac{\pi}{4} \\
(d) & \quad \frac{\pi}{3}
\end{align*}
\]

Ans. (a)

Solution. We can write

\[
I = \int_{\pi/6}^{\pi/3} \frac{\sqrt{\cos x}}{\cos x + \sqrt{\sin x}} \, dx
\]

Using \( \int_a^b f(x) \, dx = \int_a^{a+b} f(x-a+b) \, dx \), we can write

\[
I = \int_{\pi/6}^{\pi/3} \frac{\sqrt{\cos (\pi/2 - x)}}{\cos (\pi/2 - x) + \sqrt{\sin (\pi/2 - x)}} \, dx
\]

\[
= \int_{\pi/6}^{\pi/3} \frac{\sqrt{\sin x}}{\sin x + \sqrt{\cos x}} \, dx
\]

Adding (1) and (2), we get

\[
2I = \int_{\pi/6}^{\pi/3} dx = x]_{\pi/6}^{\pi/3} = \frac{\pi}{6}
\]

\[\Rightarrow I = \frac{\pi}{12}\]
Solve

\[ \int_{0}^{\pi} (2 \log \sin x - \log \sin 2x) \, dx \]

Let \( I = \int_{0}^{\pi} (2 \log \sin x - \log \sin 2x) \, dx \)

\[ \Rightarrow I = \int_{0}^{\pi} \left( 2 \log \sin x - \log (2 \sin x \cos x) \right) \, dx \]

\[ \Rightarrow I = \int_{0}^{\pi} \left( 2 \log \sin x - \log \sin x - \log \cos x - \log 2 \right) \, dx \]

\[ \Rightarrow I = \int_{0}^{\pi} \left( \log \sin x - \log \cos x - \log 2 \right) \, dx \quad - (1) \]

Applying we get

\[ \int_{0}^{a} f(x) \, dx = \int_{0}^{a} f(a-x) \, dx \]

\[ \Rightarrow I = \int_{0}^{\pi} \left( \log \cos x - \log \sin x - \log 2 \right) \, dx \quad (2) \]

Adding (1) and (2), we obtain

\[ 2I = \int_{0}^{\pi} (- \log 2 - \log 2) \, dx \]

\[ \Rightarrow 2I = -2 \log 2 \int_{0}^{\pi} 1 \, dx \]

\[ \Rightarrow I = -\log 2 \left[ \frac{\pi}{2} \right] \]

\[ \Rightarrow I = \frac{\pi}{2} \log 2 \]

\[ \Rightarrow I = \frac{\pi}{2} \log \frac{1}{2} \]

\[ \Rightarrow I = \frac{\pi}{2} \log \frac{1}{2} \]

**Example - 2.5 -**
Solve
\[ \int_{\frac{\pi}{2}}^{\pi} \sin^2 x \, dx \]

Sin² x is an even function. Recall if we replace x with -x and then get the same value as the original function then it is an even function. \( \sin^2(-x) = \sin^2 x \)

So we apply
\[ \int_0^\pi f(x) \, dx = 2 \int_0^{\pi/2} f(x) \, dx \]

\[ I = 2 \int_0^{\pi/2} \sin^2 x \, dx \]
\[ = 2 \int_0^{\pi/2} \frac{1 - \cos 2x}{2} \, dx \]
\[ = \int_0^{\pi/2} (1 - \cos 2x) \, dx \]
\[ = \left[ x - \frac{\sin 2x}{2} \right]_0^{\pi/2} \]
\[ = \frac{\pi}{2} \]

We could have also done
\[ I = \int_0^{\pi/2} \cos^2 x \, dx \quad (1) \]
\[ \Rightarrow I = \int_0^{\pi/2} \cos^2 \left( \frac{\pi}{2} - x \right) \, dx \]
\[ \Rightarrow I = \int_0^{\pi/2} \sin^2 x \, dx \quad (2) \]

And then as before
\[ 2I = \int_0^{\pi/2} (\sin^2 x + \cos^2 x) \, dx \]
\[ \Rightarrow 2I = \int_0^{\pi/2} 1 \, dx \]
\[ \Rightarrow 2I = \left[ x \right]_0^{\pi/2} \]
\[ \Rightarrow 2I = \frac{\pi}{2} \]
\[ \Rightarrow I = \frac{\pi}{4} \]

So result is \( 2 \times \pi/4 = \pi/2 \)

But ideally I would have solved these problems by using gamma function
show that
\[ \int_{0}^{\pi/2} \sin^{m} x \cos^{n} x \, dx = \frac{\Gamma \left( \frac{m+1}{2} \right) \Gamma \left( \frac{n+1}{2} \right)}{2 \Gamma \left( \frac{m+n+2}{2} \right)} \]
where \( m \) and \( n \) are integers.

Proof

Case I. When \( n = 0 \). Then
\[
\int_{0}^{\pi/2} \sin^{m} x \cos^{n} x \, dx = \int_{0}^{\pi/2} \sin^{m} x \, dx
\]

\[
= \left[ \frac{\sin^{m-1} x \cos x}{m} \right]_{0}^{\pi/2} + \frac{m-1}{m} \int_{0}^{\pi/2} \sin^{m-2} x \, dx
\]

\[
= \frac{m-1}{m} \int_{0}^{\pi/2} \sin^{m-2} x \, dx
\]

Learn more about Gamma function at

https://zookeepersblog.wordpress.com/gamma-function-integral-calculus/

So
\[
\int_{0}^{\pi} \sin^{2} x \, dx = \int_{0}^{\pi} \cos^{2} x \, dx = \frac{\Gamma \left( \frac{2+1}{2} \right) \Gamma \left( \frac{2}{2} \right)}{2 \Gamma \left( \frac{2+0+2}{2} \right)} \text{ recall } \Gamma \left( \frac{1}{2} \right) = \sqrt{\pi}
\]

\[
\Gamma \left( \frac{3}{2} \right) = \frac{1}{2} \Gamma \left( \frac{1}{2} \right) \text{ because } \Gamma \left( \frac{n+1}{2} \right) = n \Gamma \left( \frac{n}{2} \right) 3/2 \text{ is } \left( \frac{1}{2} + 1 \right) \text{ so } n = \frac{1}{2}
\]

\[
\Gamma(2) = 1 \text{ because } \Gamma(1) = 1 \text{ So Integral } = \left( (\sqrt{\pi}) \left( \sqrt{\pi} \right) \right) / 2 = \pi / 4
\]

Example - 2.6 - These type of problems are known as removal of x
\[
\int_0^\pi \frac{x \, dx}{1 + \sin x}
\]

Solve

Let \( I = \int_0^\pi \frac{x \, dx}{1 + \sin x} \) - (1)

\[\Rightarrow I = \int_0^\pi \frac{(\pi - x)}{1 + \sin (\pi - x)} \, dx \]

\[\Rightarrow I = \int_0^\pi \frac{(\pi - x)}{1 + \sin x} \, dx - (2)\]

Adding (1) and (2)

\[2I = \int_0^\pi \frac{\pi}{1 + \sin x} \, dx\]

\[\Rightarrow 2I = \pi \int_0^\pi \frac{1 - \sin x}{(1 + \sin x)(1 - \sin x)} \, dx\]

\[\Rightarrow 2I = \pi \int_0^\pi \frac{1 - \sin x}{\cos^2 x} \, dx\]

\[\Rightarrow 2I = \pi \int_0^\pi \left\{\sec^2 x - \tan x \sec x\right\} \, dx\]

\[\Rightarrow 2I = \pi \left[\tan x - \sec x\right]_0^\pi\]

\[\Rightarrow 2I = \pi [2]\]

\[\Rightarrow I = \pi\]

Example - 2.7 -
Solve \( \int_{\frac{\pi}{2}}^{\pi} \sin^7 x \, dx \)

\( \sin^7 x \) is an odd function. Because \( \sin^7 (-x) = -\sin^7 x \) So we use

\( \int_{a}^{b} f(x) \, dx = 0 \)

So answer is 0

**Example - 2.8 -**

Solve \( \int_{0}^{2\pi} \cos^5 x \, dx \)

Let \( I = \int_{0}^{2\pi} \cos^5 x \, dx \) \( \ldots \) \( (1) \)

\( \cos^5 (2\pi - x) = \cos^5 x \)

We have

\[
\int_{0}^{2\pi} f(x) \, dx = 2 \int_{0}^{\pi} f(x) \, dx, \text{ if } f(2\pi - x) = f(x) \\
= 0 \text{ if } f(2\pi - x) = -f(x) \\
\therefore I = 2 \int_{0}^{\pi} \cos^5 x \, dx \\
\Rightarrow I = 2(0) = 0 \quad [\cos^5 (\pi - x) = -\cos^5 x] \\
\]

**Example - 2.9 -**
Solve

Adding \((1)\) and \((2)\)

\[
2I = \int_0^\pi \frac{0}{1 + \sin x \cos x} \, dx
\]
\[
\Rightarrow I = 0
\]

Example - 2.10 -

Solve

\[
\int_0^\pi \log(1 + \cos x) \, dx
\]

Let \(I = \int_0^\pi \log(1 + \cos x) \, dx \cdot (1)\)

\[
\Rightarrow I = \int_0^\pi \log(1 + \cos(\pi - x)) \, dx
\]
\[
\Rightarrow I = \int_0^\pi \log(1 - \cos x) \, dx \cdot (2)
\]

Adding \((1)\) and \((2)\)
Adding (4) and (5) we get

\[2I = \int_0^\pi \{\log(1 + \cos x) + \log(1 - \cos x)\} \, dx\]
\[\Rightarrow 2I = \int_0^\pi \log(1 - \cos^2 x) \, dx\]
\[\Rightarrow 2I = \int_0^\pi \log \sin^2 x \, dx\]
\[\Rightarrow 2I = 2 \int_0^\pi \log \sin x \, dx\]
\[\Rightarrow I = \int_0^\pi \log \sin x \, dx \quad \cdots (3)\]

\[\sin (\pi - x) = \sin x\]
\[\therefore I = 2 \int_0^{\pi/2} \log \sin x \, dx \quad \cdots (4)\]

\[\Rightarrow I = 2 \int_0^{\pi/2} \log \sin \left(\frac{\pi}{2} - x\right) \, dx = 2 \int_0^{\pi/2} \log \cos x \, dx\]

\[- (5)\]

Adding (4) and (5) we get

\[2I = \int_0^\pi (\log \sin x + \log \cos x) \, dx\]
\[\Rightarrow I = \int_0^\pi (\log \sin x + \log \cos x + \log 2 - \log 2) \, dx\]
\[\Rightarrow I = \int_0^\pi (\log 2 \sin x \cos x - \log 2) \, dx\]
\[\Rightarrow I = \int_0^\pi \log 2 \sin 2x \, dx - \int_0^\pi \log 2 \, dx\]

Let \(2x = t\) so \(2 \, dx = dt\) when \(x = 0\) \(t = 0\) and when \(x = \pi/2\) \(t = \pi\)
\[\therefore I = \frac{1}{2} \int_0^\pi \log t \, dt - \frac{\pi}{2} \log 2\]
\[\Rightarrow I = \frac{1}{2} I - \frac{\pi}{2} \log 2\]
\[\Rightarrow I = -\frac{\pi}{2} \log 2\]
\[\Rightarrow I = -\pi \log 2\]
Example - 2.11 -

\[ \int \frac{\sqrt{x}}{\sqrt{x} + \sqrt{a - x}} \, dx \]

Solve

\[ I = \int \frac{\sqrt{a - x}}{\sqrt{a - x} + \sqrt{x}} \, dx \]

Add with

\[ 2I = \int \frac{\sqrt{x} + \sqrt{a - x}}{\sqrt{x} + \sqrt{a - x}} \, dx \]

\[ \Rightarrow 2I = \int_{0}^{a} 1 \, dx \]

\[ \Rightarrow 2I = \left[ x \right]_{0}^{a} \]

\[ \Rightarrow 2I = a \]

\[ \Rightarrow I = \frac{a}{2} \]

Similarly

\[ I = \int_{3}^{5} \frac{\sqrt{x}}{\sqrt{8 - x} + \sqrt{x}} \, dx \] then \( I \) equals

(a) 1  
(b) 2  
(c) 3  
(d) 3.5

Ans. (a)

Solution Using the property

\[ \int_{a}^{b} f(x) \, dx = \int_{a}^{b} f(a + b - x) \, dx \]

we can write

\[ I = \int_{3}^{5} \frac{\sqrt{8 - x}}{\sqrt{x} + \sqrt{8 - x}} \, dx \]

Adding

\[ 2I = \int_{3}^{5} \frac{\sqrt{x} + \sqrt{8 - x}}{\sqrt{x} + \sqrt{8 - x}} \, dx = \int_{3}^{5} dx = x \bigg|_{3}^{5} \]

\[ \Rightarrow 2I = 5 - 3 = 2 \Rightarrow I = 1. \]
AIEEE (now known as IIT-JEE main) - 2002

\[ \int_{-\pi}^{\pi} \frac{2x(1 + \sin x)}{1 + \cos^2 x} \, dx \]
(a) \( \frac{\pi}{4} \)  
(b) \( \pi^2 \)  
(c) 0  
(d) \( \frac{\pi}{2} \)

\( \text{(b)} \) : 
\[ 2 \int_{-\pi}^{\pi} \frac{x}{1 + \cos^2 x} \, dx + 2 \int_{-\pi}^{\pi} \frac{x \sin x}{1 + \cos^2 x} \, dx \]

= 0 + 2 \int_{-\pi}^{\pi} \frac{x \sin x}{1 + \cos^2 x} \, dx

= 2 \int_{-\pi}^{\pi} \frac{x \sin x}{1 + \cos^2 x} \, dx

= 4 \int_{0}^{\pi} \frac{x \sin x}{1 + \cos^2 x} \, dx

= 4 \times \frac{\pi}{2} \int_{0}^{\pi} \frac{\sin x}{1 + \cos^2 x} \, dx

(by using \( \int_{0}^{\pi} x f(\sin x) \, dx = \frac{\pi}{2} \int_{0}^{\pi} f(\sin x) \, dx \))

= 4 \times \frac{\pi}{2} \times 2 \int_{0}^{\frac{\pi}{2}} \frac{\sin x}{1 + \cos^2 x} \, dx

= 4\pi (\tan^{-1} \cos x)_{0}^{\frac{\pi}{2}} \quad \text{(By putting \( \cos x = t \))}

= 4\pi \left( \frac{\pi}{4} - 0 \right)

= \pi^2
AIEEE (now known as IIT-JEE main) - 2005

The value of \( \int_{-\pi}^{\pi} \frac{\cos^2 x}{1 + a^{x}} \, dx \), \( a > 0 \), is

(a) \( \pi/2 \)  
(b) \( a\pi \)  
(c) \( 2\pi \)  
(d) \( \pi/a \)

Solution

(a) : Let \( f(x) = \int_{-\pi}^{\pi} \frac{\cos^2 x}{1 + a^{-x}} \, dx \)  
\( (a > 0) \) \( \ldots(1) \)

\[ f(x) = \int_{-\pi}^{\pi} \frac{\cos^2 x}{1 + a^{-x}} \, dx \]

\[ \int_{a}^{b} f(x) \, dx = \int_{a}^{b} f(a + b - x) \, dx \]

\[ f(x) = \int_{-\pi}^{\pi} \frac{a^x \cos^2 x}{1 + a^x} \, dx \] \( \ldots(2) \)

\[ 2f(x) = \int_{-\pi}^{\pi} \cos^2 x \, dx = \int_{0}^{\pi} \cos^2 x \, dx \]

\[ = 2 \times \int_{0}^{\pi/2} \cos^2 x \, dx, \quad 2f(x) = 4 \times \frac{1}{2} \times \frac{\pi}{2} \]

By using \( \int_{0}^{\pi/2} \sin^2 x \, dx \)

\[ = \frac{n-1}{n} \times \frac{n-3}{n-2} \times \ldots \times \frac{1}{2} \times \frac{\pi}{2} \] if \( n \) is even

\[ f(x) = \frac{\pi}{2} \]

Spoon feed with \( \sin^2 x \)

If \( I = \int_{-\pi}^{\pi} \frac{\sin^2 x}{1 + a^x} \, dx \) \( \ldots(1) \)

\( a > 0 \), then \( I \) equals

(a) \( \pi \)  
(b) \( \pi/2 \)  
(c) \( a\pi \)  
(d) \( a\pi/2 \)

Ans. (b)

Solution

As in Example 2,

\[ I = \int_{-\pi}^{\pi} \frac{(\sin(-x))^2}{1 + a^{-x}} \, dx \]

\[ = \int_{-\pi}^{\pi} \frac{a^x \sin^2 x}{1 + a^x} \, dx \] \( \ldots(2) \)
Adding (1) and (2)

\[ 2I = \int_{-\pi}^{\pi} \sin^2 x \, dx \]
\[ = 2\int_{0}^{\pi} \sin^2 x \, dx \]
\[ = \int_{0}^{\pi} (1 - \cos 2x) \, dx \]
\[ = \left[ x - \frac{\sin 2x}{2} \right]_{0}^{\pi} = \pi \]
\[ \Rightarrow I = \frac{\pi}{2}. \]

**Wallis's Formula**

If \( n \) is a positive integer then \( \int_{0}^{\pi/2} \sin^n x \, dx = \int_{0}^{\pi/2} \cos^n x \, dx \) has the value

\[ \frac{n-1}{n} \cdot \frac{n-3}{n-2} \cdot \frac{n-5}{n-4} \cdots \frac{2}{3} \text{ if } n \text{ is odd} \]

and the value

\[ \frac{n-1}{n} \cdot \frac{n-3}{n-2} \cdot \frac{n-5}{n-4} \cdots \frac{3}{4} \cdot \frac{1}{2} \cdot \frac{\pi}{2} \text{ if } n \text{ is even} \]

**Proof**

Let \( I_n = \int_{0}^{\pi/2} \sin^n x \, dx \)
\[ = \int_{0}^{\pi/2} \sin^n \left( \frac{\pi}{2} - x \right) \, dx \]
\[ = \int_{0}^{\pi/2} \cos^n x \, dx \]
\[ = \left[ \frac{\cos^{n-1} x \sin x}{n} \right]_{0}^{\pi/2} + \frac{n-1}{n} \int_{0}^{\pi/2} \cos^{n-2} x \, dx \]

\[ \Rightarrow I_n = \frac{n-1}{n} I_{n-2} \quad \ldots \text{ (1)} \]

Replacing \( n \) by \( n - 2 \), we get
\[ I_{n-2} = \frac{n-3}{n-2} I_{n-4} \quad \ldots \text{ (2)} \]

Putting the value of \( I_{n-2} \) from (2) in (1), we get
\[ I_n = \frac{n-1}{n} \cdot \frac{n-3}{n-2} I_{n-4} \quad \ldots \text{ (3)} \]
Replace $n$ by $n - 4$ in (1), we get
\[ I_{n-4} = \frac{n-5}{n-4} I_{n-6} \quad \cdots (4) \]

Putting the value of $I_{n-4}$ from (4) in (3), we get
\[ I_n = \frac{n-1}{n} \cdot \frac{n-3}{n-2} \cdot \frac{n-5}{n-4} I_{n-6} \]

Proceeding in this manner, we see that two cases arise:

**Case I.** When $n$ is odd, then

\[ I_n = \frac{n-1}{n} \cdot \frac{n-3}{n-2} \cdot \frac{n-5}{n-4} \cdots \frac{2}{3} \cdot I_1 \]

Now
\[ I_1 = \int_0^{\frac{\pi}{2}} \sin x \, dx \]
\[ = (\cos x)_{\frac{\pi}{2}}^{\frac{\pi}{2}} \]
\[ = 1 \]
\[ \therefore \quad I_n = \frac{n-1}{n} \cdot \frac{n-3}{n-2} \cdot \frac{n-5}{n-4} \cdots \frac{2}{3} \]

**Case II.** When $n$ is even, then

\[ I_n = \frac{n-1}{n} \cdot \frac{n-3}{n-2} \cdot \frac{n-5}{n-4} \cdots \frac{1}{2} \cdot I_0 \]

Now
\[ I_0 = \int_0^{\frac{\pi}{2}} x \sin^2 x \, dx \]
\[ = (x)^{\frac{\pi}{2}} \frac{\pi}{2} \]
\[ = \frac{\pi}{2} \]
\[ \therefore \quad I_n = \frac{n-1}{n} \cdot \frac{n-3}{n-2} \cdot \frac{n-5}{n-4} \cdots \frac{1}{2} \cdot \frac{\pi}{2} \]
AIEEE (now known as IIT-JEE main) - 2006

The value of the integral, \( \int_{3}^{6} \frac{\sqrt{x}}{\sqrt{9-x} + \sqrt{x}} \, dx \) is

(a) 1/2  (b) 3/2  (c) 2  (d) 1

Solution - (b)

\[
\int_{a}^{b} \frac{f(x)}{f(a+b+x) + f(x)} = \int_{a}^{b} \frac{f(x)}{2} \, dx = \frac{b-a}{2}
\]

\[
\int_{3}^{6} \frac{\sqrt{x}}{\sqrt{9-x} + \sqrt{x}} \, dx = \frac{6-3}{2} = \frac{3}{2}
\]

AIEEE (now known as IIT-JEE main) - 2006

\[
\int_{-\pi/2}^{\pi/2} [(x + \pi)^3 + \cos^2(x + 3\pi)] \, dx
\]

is equal to

(a) \( \frac{\pi^4}{32} \)  (b) \( \frac{\pi^4}{32} + \frac{\pi}{2} \)  (c) \( \frac{\pi}{2} \)  (d) \( \frac{\pi}{2} - 1 \)

Solution:

(c) Let \( I = \int_{-\pi/2}^{\pi/2} [(x + \pi)^3 + \cos^2(x + 3\pi)] \, dx \)

Putting \( x + \pi = z \)

also \( x = -\frac{\pi}{2} \Rightarrow z = \frac{\pi}{2} \) and \( x = -\frac{3\pi}{2} \Rightarrow z = -\frac{\pi}{2} \)

\( \therefore \quad dx = dz \)

and \( x + 3\pi = z + 2\pi \)

\( \therefore \quad I = \int_{-\pi/2}^{\pi/2} [z^3 + \cos^2(2\pi + z)] \, dz \)

\( = \int_{-\pi/2}^{\pi/2} z^3 \, dz + \int_{-\pi/2}^{\pi/2} \cos^2 z \, dz \)

\( = \frac{\pi}{2} \quad \text{and} \quad \frac{\pi}{2} \)

\( = \frac{\pi}{2} \)

Using fact \( \int_{0}^{\frac{\pi}{2}} \sin^n x \, dx \)

\( = \begin{cases} \frac{\pi}{2} & \text{if } n = 2m \\ \frac{n-1}{n} \frac{n-3}{n} \frac{1}{2} \times \frac{\pi}{2} & \text{if } n = 2m+1 \end{cases} \)
Type 3 - Special Definite Integral Formulae

Great mathematicians proved and derived many interesting results. We have to know these results as of standard 12. Deriving all of these is not in course of IIT-JEE, or PU.

\[
\begin{align*}
\int_0^{\infty} e^{-ax} \, dx &= \frac{1}{a} \quad (a > 0) \\
\int_0^{\infty} \frac{x^{a-1}}{e^x} \, dx &= \Gamma(a) \quad (a > 1, a > 0) \\
\int_0^{\infty} x^a \, dx &= \frac{n!}{a^{n+1}} \quad (n > 0, a > 0)
\end{align*}
\]

\[
\begin{align*}
\int_0^{\infty} x^2 e^{-x^2} \, dx &= \frac{\sqrt{\pi}}{2} \\
\int_0^{\infty} x^4 e^{-x^2} \, dx &= \frac{3\sqrt{\pi}}{8} \\
\int_0^{\infty} x^4 e^{-x^2} \, dx &= \frac{\sqrt{\pi}}{4} \\
\int_0^{\infty} x^4 e^{-x^2} \, dx &= 1
\end{align*}
\]

Or say to scare you more

\[
\begin{align*}
\int_0^{\pi} \ln (a + b \cos x) \, dx &= \pi \ln \left( \frac{a + \sqrt{a^2 - b^2}}{2} \right) \\
\int_0^{\pi} \ln (a^2 - 2ab \cos x + b^2) \, dx &= \begin{cases} 2\pi \ln a, & a \equiv b > 0 \\ 2\pi \ln b, & a \equiv a > 0 \end{cases} \\
\int_0^{\pi/4} \ln (1 + \tan x) \, dx &= \frac{\pi}{8} \ln 2 \\
\int_0^{\pi/2} \sec x \ln \left( \frac{1 + b \cos x}{1 + a \cos x} \right) \, dx &= \frac{1}{3} (\cos^{-1} a)^3 - (\cos^{-1} b)^3 \\
\int_0^{\pi} \ln \left( 2 \sin \frac{x}{2} \right) \, dx &= -\left( \frac{\sin a}{1^2} + \frac{\sin 2a}{2^2} + \frac{\sin 3a}{3^2} + \cdots \right)
\end{align*}
\]
While the Indian toppers of IIT-JEE will know how to do these

\[ \int_0^\pi \sin^n x \, dx \quad \therefore I_n = \frac{n - 1}{n} I_{n-2} \]

\[ \int_0^\pi \cos^n x \, dx \quad \therefore I_n = \frac{n - 1}{n} I_{n-2} \]

\[ \int_0^\pi \sin 2nx \, dx \quad \therefore I_n = \frac{2(-1)^{n-1}}{2n - 1} + I_{n-1} \]

\[ \int_0^{\pi/2} \tan^n x \, dx \quad \therefore I_n = \frac{1}{n - 1} - I_{n-2} \]

\[ \int_0^\pi e^{ax} \cos^n x \, dx \quad \therefore I_n = -\frac{a}{n^2 + a^2} + \frac{n(n - 1)}{n^2 + a^2} I_{n-2} \]

\[ \int_0^\pi x^n \cos x \, dx \quad \therefore I_n = \left( \frac{\pi}{2} \right)^n - n(n - 1) I_{n-2} \]

Some of the Derivations are given at

Solve

( This was there in the formula list above )

\[ \int_0^{\pi/4} \log (1 + \tan x) \, dx \]

Let

\[ I = \int_0^{\pi/4} \log (1 + \tan x) \, dx \]

\[ \therefore I = \int_0^{\pi/4} \log \left[ 1 + \tan \left( \frac{\pi}{4} - x \right) \right] \, dx \]

\[ \Rightarrow I = \int_0^{\pi/4} \log \left[ 1 + \tan \left( \frac{\pi}{4} - x \right) \right] \, dx \]

\[ \Rightarrow 2I = \int_0^{\pi/4} \log 2 \, dx \]

\[ \Rightarrow 2I = \frac{\pi}{4} \log 2 \]

\[ \Rightarrow I = \frac{\pi}{8} \log 2 \]
Type - 4 - Integration of a modulus function. To be done piece wise due to break or reversal of value(s) somewhere.

Example - 4.1 - Solve

\[ \int_{-5}^{5} |x + 2| \, dx \]

Around \( x = -2 \) the value of \( (x + 2) \) flips. Student can solve \( x + 2 = 0 \) to get \( x = -2 \)

In some cases there will be a Quadratic function inside the modulus. In those cases there may be two separate values around which the value of the expression flips from positive to negative, or vice versa. These are the real roots of the Quadratic Expression. If the roots of the Quadratic expression are imaginary then the expression is either positive or negative for all values of \( x \)

So \( |x + 2| = x + 2 \) for all \( x > -2 \) or rather right side of -2 (Better written as \(-2 < x\), as per number line)

And for \( x < -2 \) \( |x + 2| = -(x + 2) = -x - 2 \) This ensures that \( |x + 2| \) is always positive

Thus the integral has to be split from \(-5 \) till \(-2\) \[ meaning \(-5 \) till less than \(-2 \) or \(-2+\delta \) where \( \delta \) is very small positive number that tends to 0 \( \) ( zero ). Mathematically we write \( \lim \delta \to 0 \]

While the other part will be \(-2+\) to 5 \[ meaning \(-2+\delta \) till 5 where \( \delta \) is very small positive number that tends to 0 \( \) ( zero ).

So we have the solution as

\[
\begin{align*}
\therefore I &= \int_{-5}^{-2} -(x+2) \, dx + \int_{-2}^{5} (x+2) \, dx \\
&= \left[ \frac{x^2}{2} + 2x \right]_{-5}^{-2} + \left[ \frac{x^2}{2} + 2x \right]_{-2}^{5} \\
&= \left[ \frac{(-2)^2}{2} + 2(-2) - \frac{(-5)^2}{2} - 2(-5) \right] + \left[ \frac{(5)^2}{2} + 2(5) - \frac{(-2)^2}{2} - 2(-2) \right] \\
&= \left[ -2 - 4 - \frac{25}{2} + 10 \right] + \left[ \frac{25}{2} + 10 - 2 + 4 \right] \\
&= -2 + 4 + \frac{25}{2} - 10 + \frac{25}{2} + 10 - 2 + 4 \\
&= 29
\end{align*}
\]
Example - 4.2 - Try another one where modulus flips around 5

Solve

\[ \int_{2}^{5} |x - 5| \, dx \]

\[ X - 5 \leq 0 \text{ in } [2,5] \quad \text{and} \quad x - 5 \geq 0 \text{ in } [5,8], \text{ thus} \]

\[ I = \int_{2}^{5} -(x - 5) \, dx + \int_{5}^{8} (x - 5) \, dx \]

\[ = \left[ \frac{x^2}{2} - 5x \right]_{2}^{5} + \left[ \frac{x^2}{2} - 5x \right]_{5}^{8} \]

\[ = \left[ \frac{25}{2} - 25 - 2 + 10 \right] + \left[ 32 - 40 - \frac{25}{2} + 25 \right] \]

\[ = 9 \]

Spoon feed

If \( I = \int_{-3}^{2} (lx + 11 + lx + 2l + lx - 1l) \, dx \), then

\( I \) equals

(a) \( \frac{31}{2} \)  
(b) \( \frac{35}{2} \)  
(c) \( \frac{37}{2} \)  
(d) \( \frac{39}{2} \)

Ans. (a)

Solution

We can write

\( I = I_1 + I_2 + I_3 \)

where \( I_1 = \int_{-3}^{2} lx + 1l \, dx \) etc.

Put \( x + 1 = t \), so that

\( I_1 = \int_{-2}^{3} |t| \, dt = \int_{-2}^{0} (-t) \, dt + \int_{0}^{3} t \, dt \)

\[ = -\frac{1}{2} t^2 \bigg|_{-2}^{0} + \frac{1}{2} t^2 \bigg|_{0}^{3} = \frac{13}{2} \]

Similarly, \( I_2 = I_3 = \frac{9}{2} \)

Thus, \( I = \frac{31}{2} \).
Example - 4.3 - Try to integrate modulus of Quadratic function

Let us cook the Quadratic Q(x) such that it has roots 1 and 7

So Q(x) will be \((x - 1)(x - 7) = x^2 - 8x + 7\)

The graph will be

It is obvious that Q(x) is +ve when x is less than 1 or when x is greater than 7.

Q(x) is negative when x is in between 1 or 7 (\(1 < x < 7\))

Now if we need to find \(\int_{-10}^{11} |Q(x)| \, dx\) then we have to split from -10 to 1 then 1 to 7 and 7 to 11

\[
\int_{-10}^{1} (x^2 - 8x + 7) \, dx + \int_{1}^{7} (x^2 - 8x + 7) \, dx + \int_{7}^{11} (x^2 - 8x + 7) \, dx
\]

If the Quadratic function has imaginary roots \(b^2 < 4ac\) (say \(b = 2\), \(a = 3\) and \(c = 4\))

It will be above x axis always (a being positive)

\[Q(x) = 3x^2 + 2x + 4\] which will have a graph of

So if we have to integrate from any lower limit to any higher limit of \(|3x^2 + 2x + 4|\) if will be straight away done by integrating \(3x^2 + 2x + 4\)
AIEEE (now known as IIT-JEE main) - 2002

\[ \int_0^{10\pi} |\sin x| \, dx = \int_0^{\pi} |\sin x| \, dx - \int_0^{\pi} |\sin x| \, dx = 10 \times 2 - 1 \times 2 = 18 \] (Using period of |\sin x| = \pi)

AIEEE (now known as IIT-JEE main) - 2004

The value of \( \int_{-2}^{3} |1-x^2| \, dx \) is

(a) 7/3 (b) 14/3 (c) 28/3 (d) 1/3

The value of the Quadratic flips around -1 and 1

\( (c) \ : \int_{-2}^{3} |1-x^2| \, dx = \int_{-2}^{3} (1-x)(1+x) \, dx \)

Putting \( 1-x^2 = 0 \) : \( x = \pm 1 \)

Points \(-2, -1, 1, 3\)

\[ |1-x^2| = \begin{cases} 1-x^2 & \text{if } |x|<1 \\ (1-(1-x^2)) & \text{if } x<-1 \text{ and } x \geq 1 \end{cases} \]

\[ \int_{-2}^{3} (1-x^2) \, dx = \int_{-2}^{1} (x^2-1) \, dx + \int_{1}^{\frac{3}{2}} (x^2-1) \, dx \]

\[ = \frac{4}{3} + 2 \left( \frac{2}{3} \right) + \frac{20}{3} = \frac{28}{3} \]
Example - 4.4 -

If \( I = \int_{-\pi/6}^{\pi/6} \frac{\pi + 4x^5}{1 - \sin(|x| + \pi/6)} \, dx \), then \( I \) equals

(a) \( 4\pi \)  
(b) \( 2\pi + \sqrt{3} \)  
(c) \( 2\pi - \sqrt{3} \)  
(d) \( 4\pi + \sqrt{3} - \sqrt{3}\)

**Ans. (a)**

**Solution** As \( \frac{4x^5}{1 - \sin(|x| + \pi/6)} \) is an odd function, and \( \frac{\pi}{1 - \sin(|x| + \pi/6)} \) is an even function, we get

\[
I = 2\pi \int_{0}^{\pi/6} \frac{dx}{1 - \sin(x + \pi/6)}
\]

Put \( x + \pi/6 = t, \, dx = dt \)

\[
I = 2\pi \int_{\pi/6}^{\pi/3} \frac{dt}{1 - \sin t} = 2\pi \int_{\pi/6}^{\pi/3} \frac{1 - \sin t}{\cos^2 t} \, dt
\]

\[
= 2\pi \left[ \left( \tan t + \sec t \right) \right]_{\pi/6}^{\pi/3}
\]

\[
= 2\pi \left( (\sqrt{3} + 2) - \left( \frac{1}{\sqrt{3}} + \frac{2}{\sqrt{3}} \right) \right) = 4\pi
\]
Type 5 - Cousins of $\beta$ functions

Beta functions are not directly in course. But in past 50 years, twice in IIT-JEE we had similar problems.

Let us start with an easy example - 5.1 - Which can be solved by

$$\int_{0}^{a} f(x) \, dx = \int_{0}^{a} f(a-x) \, dx$$

Find

$$\int_{0}^{1} x(1-x)^n \, dx$$

Let $I = \int_{0}^{1} x(1-x)^n \, dx$

$$= \left[ \frac{1}{n+1} - \frac{1}{n+2} \right]$$

$$= \left[ \frac{n+2}{n+1(n+2)} \right]$$

The same problem was asked in AIEEE (now known as IIT-JEE main) - 2003

So solving in another way for practice

The value of the integral $I = \int_{0}^{1} x(1-x)^n \, dx$ is

(a) $\frac{1}{n+2}$

(b) $\frac{1}{n+1} - \frac{1}{n+2}$

(c) $\frac{1}{n+1} + \frac{1}{n+2}$

(d) $\frac{1}{n+1}$
This was simplified version of Gamma Function. In fact Beta Function and Gamma Function are related.
Example - 5.2 -

Solve

\[ \int_{0}^{2} x \sqrt{2-x} \, dx \]

Let \( I = \int_{0}^{2} x \sqrt{2-x} \, dx \)

\[
I = \int_{0}^{2} (2-x) \sqrt{x} \, dx = \int_{0}^{2} \left\{ \frac{1}{2} x^2 - \frac{3}{2} \right\} \, dx
\]

\[
= \left[ 2 \left( \frac{x^3}{3} \right) - \frac{x^5}{5} \right]_{0}^{2} = \frac{4}{3} (2)^3 - \frac{2}{5} (2)^5
\]

\[
= \frac{4 \times 2 \sqrt{2}}{3} - \frac{2}{5} \times 4 \sqrt{2}
\]

\[
= \frac{8 \sqrt{2}}{3} - \frac{8 \sqrt{2}}{5}
\]

\[
= \frac{40 \sqrt{2} - 24 \sqrt{2}}{15} = \frac{16 \sqrt{2}}{15}
\]
Example - 5.3 -

Evaluate \( \int_0^{2a} x^{\frac{3}{2}} (2a - x)^{-\frac{1}{2}} \, dx \).

Solution:

\[
I = \int_0^{2a} x^{\frac{3}{2}} (2a - x)^{-\frac{1}{2}} \, dx
\]

Put \( x = 2a \sin^2 \theta \)

\[
\therefore \, \, dx = 4a \sin \theta \cos \theta \, d\theta
\]

\[
= \int_0^{\frac{\pi}{2}} (2a)^{\frac{3}{2}} \sin^9 \theta (2a - 2a \sin^2 \theta)^{-\frac{1}{2}} \cdot 4a \sin \theta \cos \theta \, d\theta
\]

\[
= \int_0^{\frac{\pi}{2}} (2a)^{\frac{3}{2}} \cdot \sin^9 \theta \cdot (2a)^{-\frac{1}{2}} \cos \theta \cdot 4a \sin \theta \cos \theta \, d\theta
\]

\[
= (2a)^{\frac{5}{2}} \cdot 4a \cdot \int_0^{\frac{\pi}{2}} \sin^{10} \theta \, d\theta
\]

\[
= 64a^5 \cdot \frac{9}{10} \cdot \frac{7}{8} \cdot \frac{5}{6} \cdot \frac{3}{4} \cdot \frac{1}{2} \cdot \frac{\pi}{2}
\]

Using Walli's formula

\[
= \frac{63 \pi a^5}{8}
\]

Example - 5.4 -

If \( I_n = \int_0^a \left( a^2 - x^2 \right)^n \, dx \), and \( n > 0 \), prove that

\[
I_n = \frac{2na^2}{2n+1} I_{n-1}.
\]

Solution:

We have

\[
I_n = \int_0^a \left( a^2 - x^2 \right)^n \, dx
\]

Put \( x = a \sin \theta \)

\[
\therefore \, \, dx = a \cos \theta \, d\theta
\]

\[
= \int_0^{\frac{\pi}{2}} a^{2n+1} \left( a^2 - a^2 \sin^2 \theta \right)^n (a \cos \theta) \, d\theta
\]

\[
= a^{2n+1} \int_0^{\frac{\pi}{2}} \cos^{2n+1} \theta \, d\theta
\]

\[
= a^{2n+1} \left[ \left( \frac{\cos^{2n} \theta \sin \theta}{2n+1} \right) \bigg|_0^{\frac{\pi}{2}} + \frac{2n}{2n+1} \int_0^{\frac{\pi}{2}} \cos^{2n+1} \theta \, d\theta \right]
\]
Type 6 - Integration with greatest Integer functions ( Also known as floor Function )

\[ [ 2.3 ] = 2 \quad \text{while} \quad [ 2.9 ] \text{ is also 2 as it is the Integer equal or below ( lesser ) than the number} \]

Note - most average students make an error in floor of negative number \([ -6.3 ] \) is -7 as -7 is the integer just lesser than -6.(whatever)

Floor function is also written as \( \lfloor x \rfloor \)

Example - 6.1 -

The value of the integral \( \int_{0}^{[x]} (x - [x]) \, dx \) is

(a) \( [x] \)  
(b) \( \frac{1}{2} [x] \)  
(c) \( 3 [x] \)  
(d) \( 2 [x] \)
Solution:

\[
\int_{0}^{2[x]} (x-[x]) \, dx = \int_{0}^{2[x]-1} (x-[x]) \, dx \\
= 2[x] \int_{0}^{1} (x-[x]) \, dx \\
[\because x-[x] \text{ is a periodic fn of period 1}] \\
= 2[x] \left( \frac{x^2}{2} \bigg|_{0}^{1} - \int_{0}^{1} [x] \, dx \right) = 2[x] \left( \frac{1}{2} - 0 \right) = [x]
\]

AIEEE (now known as IIT-JEE main) - 2002

\[
\int_{0}^{\sqrt{2}} x^2 \, dx \text{ is} \\
(a) \quad 2 - \sqrt{2} \\
(b) \quad 2 + \sqrt{2} \\
(c) \quad \sqrt{2} - 1 \\
(d) \quad \sqrt{2} - 2
\]

\[
(c) : \int_{0}^{\sqrt{2}} x^2 \, dx = \int_{0}^{1} x^2 \, dx + \int_{1}^{\sqrt{2}} x^2 \, dx \\
= 0 + \int_{1}^{\sqrt{2}} 1 \, dx = \sqrt{2} - 1
\]
Spoon feed

If \( I = \int_0^{1.7} [x^2] \, dx \), then \( I \) equals

(a) \( 2.4 + \sqrt{2} \)  
(b) \( 2.4 - \sqrt{2} \)  
(c) \( 2.4 - \sqrt{2} \)  
(d) \( 2.4 - 1\sqrt{2} \)

**Ans. (b)***

**Solution**  
Put \( x^2 = t \)

or \( x = \sqrt{t} \) \( \Rightarrow dx = \frac{1}{2\sqrt{t}} \, dt \)

\[
\therefore \quad I = \int_0^{2.89} \frac{[t]}{2\sqrt{t}} \, dt \\
= \int_0^1 \frac{[t]}{2\sqrt{t}} \, dt + \int_1^2 \frac{[t]}{2\sqrt{t}} \, dt + \int_2^{2.89} \frac{[t]}{2\sqrt{t}} \, dt \\
= 0 + \int_1^2 \frac{1}{2\sqrt{t}} \, dt + \int_2^{2.89} \frac{2}{2\sqrt{t}} \, dt \\
= (\sqrt{2} - 1) + 2((1.7 - \sqrt{2}) \\
= 2.4 - \sqrt{2} \)
AIEEE (now known as IIT-JEE main) - 2002

\[ I_n = \int_0^{\pi/4} \tan^n x \, dx \] then \( \lim_{n \to \infty} n \left[ I_n + I_{n-2} \right] \) equals

(a) 1/2  (b) 1  (c) \( \infty \)  (d) 0

(b) \( I_n = \int_0^{\pi/4} \tan^n x \, dx \)

\[ I_{n-2} = \int_0^{\pi/4} \tan^{n-2} x \, dx \]

\[ \therefore I_n + I_{n-2} = \int_0^{\pi/4} \tan^n x \, dx + \int_0^{\pi/4} \tan^{n-2} x \, dx \]

\[ = \int_0^{\pi/4} \tan^{n-2} x \times (\sec^2 x - 1) \, dx + \int_0^{\pi/4} \tan^{n-2} x \, dx \]

\[ = \int_0^{\pi/4} \tan^{n-2} x \times \sec^2 x \, dx \]

\[ I_n + I_{n-2} = \frac{1}{n+1} \]

\[ \therefore n(I_n + I_{n-2}) = \frac{1}{1 + \frac{1}{n}} \]

\[ \therefore \lim_{n \to \infty} n(I_n + I_{n-2}) = 1 \]

Example (Be Careful Just because [ ] is used do not assume greatest integer function. Solve the problem as greatest Integer only if it is told or as per context.)
The value of

\[ I = \int_{-2}^{0} [x^3 + 3x^2 + 3x + (x + 1) \cos (x + 1)] \, dx, \]

is

(a) \(-4\) \hspace{1cm} (b) \(-3\)
(c) \(-2\) \hspace{1cm} (d) \(-1\)

Ans. (c)

Solution

We can write

\[ I = \int_{-2}^{0} [(x + 1)^3 - 1 + (x + 1) \cos (x + 1)] \, dx \]

Put \(x + 1 = t\), so that

\[ I = \int_{-1}^{1} [t^3 - 1 + t \cos t] \, dt \]

\[ = \int_{-1}^{1} (-1) \, dt = -1 \]

As \(t^3 + t \cos t\) is an odd function

AIEEE (now known as IIT-JEE main) - 2006

The value of \(\int_{1}^{a} f'(x) \, dx, \ a > 1, \) where \([x]\) denotes the greatest integer not exceeding \(x\) is

(a) \(af'(a) - \{f(1) + f(2) + \ldots + f([a])\}\)
(b) \([a]f'(a) - \{f(1) + f(2) + \ldots + f([a])\}\)
(c) \([a]f'([a]) - \{f(1) + f(2) + \ldots + f(a)\}\)
(d) \(af([a]) - \{f(1) + f(2) + \ldots + f(a)\}\)
Solution:

(b) \[ \int_{a}^{\alpha} f'(x) \, dx \text{, say } [a] = K \text{ such that } a > 1 \]

\[ \int_{a}^{\alpha} f''(x) \, dx + \int_{\frac{a}{2}}^{\frac{a}{2}} f'(x) \, dx + \ldots + \int_{\frac{K}{2}}^{\frac{K}{2}} f''(x) \, dx + \int_{\frac{K}{2}}^{\alpha} f'(x) \, dx \]

\[ = f(2) - f(1) + 2[f(3) - f(3)] + 3[f(4) - f(3)] + \ldots \]

\[ (K - 1) [f(K) - f(K - 1)] + K[f(a) - f(K)] = -[f(1) + f(2) + \ldots + f(K)] + K f(a) \]

\[ = [a] f(a) - [f(1) + f(2) + \ldots + f([a])] \]

Example - 6.2 -

If \[ I = \int_{-1}^{1} \left[ x^2 + \log \left( \frac{2 + x}{2 - x} \right) \right] \, dx \] (1)

where \([x]\) denotes the greatest integer \(\leq x\), then \(I\) equals

(a) -2 \hspace{1cm} (b) -1 \hspace{1cm} (c) 0 \hspace{1cm} (d) 1

Ans. (c)

Solution: As \(\log \left( \frac{2 + x}{2 - x} \right)\) is an odd function, we can write

\[ I = \int_{-1}^{1} [x^2] \, dx + 0 \]

But for \(-1 < x < 1, 0 \leq x^2 < 1\) and thus, \([x^2] = 0\)

\[ \therefore I = 0. \]
Example - 6.3 -

\[ \int_{-2}^{2} x^2 \, dx \] is equal to

(a) \( 10 - 2\sqrt{3} - 2\sqrt{2} \)  
(b) \( 10 + 2\sqrt{3} - 2\sqrt{2} \)  
(c) \( 10 - 2\sqrt{3} + 2\sqrt{2} \)  
(d) none of these

Solution

(a. \( \int_{-2}^{2} x^2 \, dx = 2 \int_{0}^{2} x^2 \, dx \)  [\( \because \) integrand is even]

\[ = 2 \left[ \int_{0}^{1} x^2 \, dx + \int_{1}^{\sqrt{2}} x^2 \, dx + \int_{\sqrt{2}}^{\sqrt{3}} x^2 \, dx + \int_{\sqrt{3}}^{2} x^2 \, dx \right] \]

\[ \because x^2 = 0 \text{ if } 0 \leq x < 1; \quad 1 \text{ if } 1 \leq x < \sqrt{2}; \]

\[ 2 \text{ if } \sqrt{2} \leq x < \sqrt{3}; \quad 3 \text{ if } \sqrt{3} \leq x < 2 \]

\[ = 2 \left[ \int_{0}^{1} 1 \, dx + \int_{1}^{\sqrt{2}} x \, dx + \int_{\sqrt{2}}^{\sqrt{3}} 2 \, dx + \int_{\sqrt{3}}^{2} 3 \, dx \right] \]

\[ = (10 - 2\sqrt{3} - 2\sqrt{2}) \]
**Type - 7 - Problems with functions, derivatives, with some given conditions etc. These are more common to be asked in various Engineering entrance exams.**

**AIEEE (now known as IIT-JEE main) - 2003**

Let \( f(x) \) be a function satisfying \( f'(x) = f(x) \) with \( f(0) = 1 \) and \( g(x) \) be a function that satisfies \( f(x) + g(x) = x^2 \). Then the value of the integral

\[
\int_0^1 f(x) g(x) \, dx
\]

is

(a) \( e + \frac{e^2}{2} - \frac{3}{2} \)

(b) \( e - \frac{e^2}{2} - \frac{3}{2} \)

(c) \( e + \frac{e^2}{2} + \frac{5}{2} \)

(d) \( e - \frac{e^2}{2} - \frac{5}{2} \)

\[\therefore \int_0^1 f(x) g(x) \, dx = \int_0^1 e^x (x^2 - e^x) \, dx\]

\[= \int_0^1 x^2 e^x \, dx - \int_0^1 e^x \, dx\]

\[= [x^2 e^x - 2x + 2]e^x\bigg|_0^1 - \left(\frac{e^2}{2}\right)\bigg|_0^1\]

\[= (e - 2) - \left(\frac{e^2 - 1}{2}\right)\]

\[= e - \frac{e^2}{2} - \frac{3}{2} \]

Using \( f^n(x)e^x \, dx = e^x[f^n(x) - f_1^n(x) + f_2^n(x) + \ldots + (-1)^n f_n(x)] \)

where \( f_1, f_2, \ldots, f_n \) are derivatives of first, second, ... \( n \)th order.
Example - 7.1 -

Let \( g(x) = \int_0^x f(t) \, dt \), where \( f \) is such that \( \frac{1}{2} \leq f(t) \leq 1 \) for \( t \in [0, 1] \) and \( 0 \leq f(t) \leq \frac{1}{2} \) for \( t \in [1, 2] \). Then,

(a) \( \frac{3}{2} \leq g(2) \leq \frac{1}{2} \)  
(b) \( \frac{3}{2} \leq g(2) \leq \frac{5}{2} \)  
(c) \( \frac{1}{2} \leq g(2) \leq \frac{3}{2} \)  
(d) none of these

Solution :

(c). We have, \( g(2) = \int_0^2 f(t) \, dt \)

\( = \int_0^1 f(t) \, dt + \int_1^2 f(t) \, dt \) ... (i)

Now, \( \frac{1}{2} \leq f(t) \leq 1 \), for \( t \in [0, 1] \)

and, \( 0 \leq f(t) \leq \frac{1}{2} \), for \( t \in [1, 2] \)

\( \Rightarrow \frac{1}{2} (1 - 0) \leq \int_0^1 f(t) \, dt \leq 1 (1 - 0) \)

and, \( 0 (2 - 1) \leq \int_1^2 f(t) \, dt \leq \frac{1}{2} (2 - 1) \)
\[ m \leq f(x) \leq M \text{ for } x \in [a, b] \]
\[ \Rightarrow m(b-a) \leq \int_a^b f(x) \, dx \leq M(b-a) \]
\[ \Rightarrow \frac{1}{2} \leq \int_0^1 f(t) \, dt \leq 1 \text{ and } 0 \leq \int_1^2 f(t) \, dt \leq \frac{1}{2} \]
\[ \Rightarrow \frac{1}{2} \leq \int_0^1 f(t) \, dt + \int_1^2 f(t) \, dt \leq \frac{3}{2} \]
\[ \Rightarrow \frac{1}{2} \leq \int_0^2 f(t) \, dt \leq \frac{3}{2} \text{ or } \frac{1}{2} \leq g(2) \leq \frac{3}{2} \]

**AIEEE (now known as IIT-JEE main) - 2003**

If \( f(y) = e^y, \ g(y) = y; y > 0 \) and

\[ F(t) = \int_0^t f(t-y)g(y) \, dy, \text{ then} \]

(a) \( F(t) = e^t - (1 + t) \)

(b) \( F(t) = te^t \)

(c) \( F(t) = te^{-t} \)

(d) \( F(t) = 1 - e^t(1 + t). \)

(a) : From given \( F(t) = \int_0^t f(t-y) \, g(y) \, dy \)

\[ = \int_0^t e^{t-y} \, y \, dy \text{ (By replacing } y \rightarrow t-y \text{ in } f(y)) \]

\[ F(t) = \left. -\left[(t - \theta)e^\theta \, d\theta \right]_0^t \right. = \int_0^t (t - \theta)e^\theta \, d\theta \]

\[ = (t e^\theta)_0^t - \left[ (0 - 1) e^\theta \right]_0^t \]

\[ = t(e^t - 1) - (t - 1)e^t - 1 \]

\[ = e^t(t - t + 1) - t - 1 \]

\[ = e^t - (t + 1) \]
Example - 7.2 -

Let \( f(x) \) be a continuous function in \([-2, 2]\) such that

\[
f(x) + f(y) = f(x + y),
\]

then \( \int_{-2}^{2} f(x) \, dx = \)

(a) \( 2 \int_{0}^{2} f(x) \, dx \)  
(b) 0  
(c) \( 2f(2) \)  
(d) none of these

Solution:

(b). Since \( f(x) + f(y) = f(x + y) \)  
...(1)

Replace \( y \) by \( -x \)

\[
\Rightarrow \ f(x) + f(-x) = f(x - x) \\
\Rightarrow \ f(x) + f(-x) = f(0) 
\]

...(2)

Also, using (1), we have

\[
f(0) + f(0) = f(0 + 0) = f(0)
\]

\[
\Rightarrow \ f(0) = 0
\]

\[
\therefore \ f(-x) = -f(x) \quad \text{using (2).}
\]

\[
\Rightarrow \int_{-2}^{2} f(x) \, dx = 0
\]
AIEEE (now known as IIT-JEE main) - 2003

If \( f(a + b - x) = f(x) \), then \( \int_{a}^{b} f(x) \, dx \) is equal to

(a) \( \frac{a+b}{2} \int_{a}^{b} f(x) \, dx \)
(b) \( \frac{b-a}{2} \int_{a}^{b} f(x) \, dx \)
(c) \( \frac{a+b}{2} \int_{a}^{b} f(a+b-x) \, dx \)
(d) \( \frac{a+b}{2} \int_{a}^{b} f(b-x) \, dx \)

\[ \therefore I = \frac{a+b}{2} \int_{a}^{b} f(x) \, dx = \frac{a+b}{2} \int_{a}^{b} f(a+b-x) \, dx \]

AIEEE (now known as IIT-JEE main) - 2003

Let \( \frac{d}{dx} F(x) = \left( \frac{\sin x}{x} \right), \quad x > 0 \).

If \( \frac{3}{x} e^{\sin x} \, dx = F(k) - F(1) \), then one of the possible values of \( k \) is

(a) 16  (b) 63  (c) 64  (d) 15

\[ \Rightarrow \int_{1}^{k} \frac{3}{x} e^{\sin z} \, dz = F(k) - F(1) \text{ where } (z^3 = z) \]
\[ \Rightarrow F(64) - F(1) = F(k) - F(1) \]
\[ \Rightarrow k = 64 \]

AIEEE (now known as IIT-JEE main) - 2004

If \( \int_{0}^{\pi} f(x) \, dx = A \int_{0}^{\pi/2} f(x) \, dx \), then \( A \) is

(a) \( \pi/4 \)  (b) \( \pi \)  (c) 0  (d) 2\( \pi \)

(b) \( \int_{0}^{\pi/2} f(x) \, dx = \int_{0}^{\pi/2} f(\sin x) \, dx \)
\[ \Rightarrow A \int_{0}^{\pi/2} f(x) \, dx = \int_{0}^{\pi/2} f(\sin x) \, dx \]
\[ \Rightarrow A = \pi \]

or \( A \int_{0}^{\pi/2} f(x) \, dx = \int_{0}^{\pi/2} f(\sin x) \, dx \)
\[ \Rightarrow A = \pi \]
AIEEE (now known as IIT-JEE main) - 2004

If \( f(x) = \frac{e^x}{1+e^x}, \) then the value of \( \frac{I_2}{I_1} \) is
(a) \(-1\)  (b) \(-3\)  (c) \(2\)  (d) \(1\)

Solution

\[
\begin{align*}
(f(x)) = \frac{e^x}{1+e^x} \\
\Rightarrow & \quad \int_a^b f(x) \, dx = \int_a^b f(a + b - x) \, dx \\
\Rightarrow & \quad 2 \int_{f(-a)}^{f(a)} xg\{x(1-x)\} \, dx = \int_{f(-a)}^{f(a)} g\{(1-x)x\} \, dx \\
\Rightarrow & \quad \frac{I_2}{I_1} = 2
\end{align*}
\]

AIEEE (now known as IIT-JEE main) - 2005

Let \( F : R \rightarrow R \) be a differentiable function having
\( f(2) = 6, \quad f'(2) = \left(\frac{1}{48}\right) \). Then \( \lim_{x \to 2} \frac{f(x)}{x-2} \) equals
(a) \(36\)  (b) \(24\)  (c) \(18\)  (d) \(12\)

Solution

\[
\begin{align*}
& \lim_{x \to 2} f'(x) \times 4(f(x))^3 \\
& = 4f'(2) \times (f(2))^3 = \frac{1}{48} \times 4 \times 6 \times 6 \times 6 = 18
\end{align*}
\]
AIEEE (now known as IIT-JEE main) - 2006

\[ \int_{0}^{\pi} f'(\sin x) \, dx \text{ is equal to} \]

(a) \( \int_{0}^{\pi} f'(\cos x) \, dx \)  
(b) \( \int_{0}^{\pi} f'(\sin x) \, dx \)  
(c) \( \frac{\pi}{2} \int_{0}^{\pi} f(\sin x) \, dx \)  
(d) \( \frac{\pi}{2} \int_{0}^{\pi} f(\cos x) \, dx \)

Solution:

(d) : Let \( I = \int_{0}^{\pi} f'(\sin x) \, dx \) \hspace{1cm} (i)

\[ I = \int_{0}^{\pi} (\pi - x) f'(\sin x) \, dx \] \hspace{1cm} (ii)

using \( \int_{0}^{a} f(x) \, dx = \int_{a}^{b} f(a - x) \, dx \)

By (i) & (ii) on adding

\[ I = \int_{0}^{\pi} f(\sin x) \, dx = 2 \int_{0}^{\pi} \frac{\pi}{2} f(\sin x) \, dx \]

using \( \int_{0}^{a} f(x) \, dx = 2 \int_{0}^{\frac{a}{2}} f(x) \, dx \) \text{ if } f(2a - x) = f(x) \]

\[ = \int_{0}^{\frac{\pi}{2}} f\left( \sin \left( \frac{\pi}{2} - x \right) \right) \, dx = \int_{0}^{\frac{\pi}{2}} f(\cos x) \, dx \]

AIEEE (now known as IIT-JEE main) - 2007

Let \( F(x) = f(x) + f\left( \frac{1}{x} \right) \), where \( f(x) = \int_{1}^{x} \frac{\ln t}{1 + t} \, dt \)

Then \( F(e) \) equals

(a) 1 \hspace{1cm} (b) 2 \hspace{1cm} (c) 1/2 \hspace{1cm} (d) 0

Solution:

(c) : \( F(x) = \int_{1}^{x} \ln t \, dt + \int_{1}^{x} \frac{\ln t}{1 + t} \, dt \)

\[ F(x) = \left[ \ln t + \frac{\ln t}{1 + t} \right]_{1}^{x} = \frac{\ln x}{1} \cdot \frac{1}{1} = \frac{1}{2} \ln x \]

\[ F(e) = \ln 2 / 2 \]
IIT - JEE 1998

If \( \int_0^x f(t) \, dt = x + \int_x^1 t \cdot f(t) \, dt \), then the value of \( f(1) \) is:

(A) \( \frac{1}{2} \)  \hspace{1cm} (B) 0  \hspace{1cm} (C) 1  \hspace{1cm} (D) \( -\frac{1}{2} \)

Solution:

\[
\int_0^x f(t) \, dt = x + \int_x^1 t \cdot f(t) \, dt,
\]

differentiating both sides w.r.t. \( x \), we get

\[
f(x) \cdot 1 = 1 - x \cdot f(x) \cdot 1
\]

\[
\Rightarrow (1 + x) f(x) = 1
\]

\[
\Rightarrow f(x) = \frac{1}{1 + x}
\]

\[
\Rightarrow f(1) = \frac{1}{2}
\]

Thus \( f(1) = \frac{1}{2} \) is the answer

Example - 7.3 -

If \( f: R \rightarrow R \) is a continuous and differentiable function such that:

\[
\int_{-1}^{x} f(t) \, dt + f'''(3) \int_{0}^{x} t^3 \, dt = \int_{-1}^{x} t^3 \, dt
\]

\[
-f''(1) \int_{0}^{x} t^2 \, dt + f''(2) \int_{0}^{x} t \, dt,
\]

then the value of \( f''(4) \) is

(a) \( 48 - 8f''(1) - f''(2) \)
(b) \( 48 + 8f''(1) - f''(2) \)
(c) \( 48 - 8f''(1) + f''(2) \)
(d) \( 48 + 8f''(1) + f''(2) \)
Solution

(a). From the given equation, we have
\[ \int_{-1}^{x} f(t) \, dt - x f''(3) \]
\[ = \left( \frac{x^4}{4} - \frac{1}{4} \right) - f'(1) \frac{x^3}{3} + f''(2) \left( \frac{9 - x^2}{2} \right) \]
Differentiating w.r.t. \( x \), we get
\[ f(x) - f''(3) = x^3 - x^2 f'(1) - x f''(2) \]
Differentiating again, we have
\[ f'(x) = 3x^2 - 2xf'(1) - f''(2) \]
\[ f'(4) = 48 - 8f'(1) - f''(2). \]

Example - 7.4 -

If \( f \) and \( g \) are two continuous functions being even and odd, respectively, then \( \int_{-a}^{a} \frac{f(x)}{b^g(x) + 1} \, dx \) is equal to \( (a \) being any non-zero number and \( b \) is positive real number, \( b \neq 1) \)
(a) independent of \( f \)
(b) independent of \( g \)
(c) independent of both \( f \) and \( g \)
(d) none of these
Solution:

\[ \int_a^b x f(x) \, dx = \int_0^b f(x) \, dx + \int_0^a f(-x) \, dx \]

\[ \int_{-a}^a \frac{f(x)}{b(g(x)) + 1} \, dx = \int_{0}^a \frac{f(x)}{b(g(x)) + 1} + \int_{0}^a \frac{f(-x)}{b(-g(x)) + 1} \]

\[ = \int_0^a \frac{f(x)}{b(g(x)) + 1} \, dx + \int_0^a \frac{f(-x)}{b(-g(x)) + 1} \]

\[ = \int f(x) \, dx, \text{ which is independent of } g \]

**Type - 8 - Differentiation of a Definite Integral often combined with L Hospital’s rule.** Generally in most schools L Hospital’s form itself is avoided. Differentiation of Definite Integrals with functions as lower and upper Limits are knows as Leibniz forms.

Learn more of Leibnitz forms at

**Leibniz Integral Rule**

\[ \frac{\partial}{\partial x} \left[ \int_{y=a(x)}^{b(x)} f(x, y) \, dy \right] = \int_{y=a(x)}^{b(x)} \frac{\partial}{\partial x} [f(x, y)] \, dy + \left[ f(x, y) \frac{\partial y}{\partial x} \right]_{y=a(x)}^{b(x)} \]

While the easier version is

\[ \frac{d}{dx} \int_{f_2(x)}^{f_1(x)} g(x) \, dx = g(f_2(x))f'_1(x) - g(f_1(x))f'_2(x) \]

Most problems of Standard 12 (Engineering entrance) are doable by the 2nd (easier) version of Leibnitz.
If \( f(x) \) is differentiable and given as
\[
\int_0^{t^2} x f(x) \, dx = \frac{2}{3} t^3
\]
then find \( f(4/25) \)

**Solution**

Differentiate both sides with respect to \( t \) (using Leibnitz 2\( ^{nd} \) form)

\[
t^2 \cdot f(t^2) \cdot 2t = \frac{2}{5} 5t^4
\]

Here if we put \( t = 2/5 \) we get \( t^2 = 4/25 \)  So \( f(4/25) = 2/5 \)

**Example - 8.1 -**

\[\text{If } F(x) = \int_3^x \left(2 + \frac{d}{dr} \cos r\right) \, dr \text{ then } F'(\pi/6) \text{ is equal to}\]

(a) \( 1/2 \)  
(b) \( 2 \)  
(c) \( 3/4 \)  
(d) \( 3/2 \)

**Ans. (d)**

**Solution**

\[F(x) = \int_3^x (2 - \sin r) \, dr \text{ so } F'(x) = 2 - \sin x.\]

Thus \( F'(\pi/6) = 2 - 1/2 = 3/2.\)

**IIT-JEE 2007**

\[
\text{Solve } \lim_{x \to \pi/4} \frac{\int_{\sec^2 x}^{2} f(t) \, dt}{x^2 - \pi^2/10}
\]

**Solution**

We can use L Hospital’s rule because it is 0/0 form. Numerator and Denominator will be differentiated separately as per Leibnitz 2\( ^{nd} \) (simple) form

\[
= \lim_{x \to \pi/4} \frac{f(\sec^2 x). (2 \sec x). (\sec x \cdot \tan x)}{2x} = \frac{8f(2)}{\pi}
\]
Note in this problem Differentiation was avoided. The numerator was actually integrated and then the problem was solved. But often the function given cannot be integrated. In those cases Leibnitz Differentiation is an option.

A beautiful problem from West Bengal JEE 2007

\[
\lim_{x \to 0} \int_0^{2x} \frac{t^2 e^t}{e^{4x^2}} dt
\]

\text{Ans : (c)}

Solution - We have

\[
\lim_{x \to \infty} \frac{\int_0^{2x} t e^t dt}{e^{4x^2}} = \infty \infty \text{ form}
\]

\[
\lim_{x \to \infty} \frac{\int_0^{2x} t e^t dt}{e^{4x^2}} \text{ using L Hospital's rule}
\]

\[
= \frac{1}{2}
\]
An alternate way of doing the above problem

Example Ratio of Integrals simplified individually

| (a) | 0 |
| (b) | 1/2 |
| (c) | 2 |
| (d) | none of these |

Solution

We know that

\[ I_{2n} = \int_0^{\pi/2} \sin^{2n} x \, dx = 2n \quad \text{and} \quad I_{2n+1} = \int_0^{\pi/2} \sin^{2n+1} x \, dx = 2n+1 \quad \text{for all } x \in (0, \pi/2), \sin^{2n+1} x > \sin^{2n} x > \sin^{2n+1} x \]

Integrating from \( 0 \) to \( \pi/2 \), we get

\[ I_{2m} - I_{2m+1} \geq I_{2m-1} \geq I_{2m} \geq I_{2m+1} \]

whence

\[ \frac{I_{2m-1}}{I_{2m+1}} \geq \frac{I_{2m}}{I_{2m+1}} \geq 1 \]

Also

\[ \frac{I_{2m-1}}{I_{2m+1}} = \frac{2m+1}{2m} \quad \text{Hence} \quad \lim_{m \to \infty} \frac{I_{2m-1}}{I_{2m+1}} = \lim_{m \to \infty} \frac{2m+1}{2m} = 1. \]

From (i) and using sandwich theorem we have

\[ \lim_{m \to \infty} \frac{I_{2m}}{I_{2m+1}} = 1. \]
Type - 9 - Some Summation problems which are solved by converting to Definite Integrals

AIEEE (now known as IIT-JEE main) - 2004

\[ \lim_{n \to \infty} \sum_{r=1}^{n} \frac{1}{n} e^{r/n} \]

- (a) \( 1 - e \)  
- (b) \( e - 1 \)  
- (c) \( e \)  
- (d) \( e + 1 \)  

Recall the basics to solve these kinds of problems

Put \( 1/n \) as \( dx \) and \( r/n \) is substituted as \( x \) the limit \( r=1 \) to \( n \) changes to Integral 0 to 1

\[ \text{(b)} : \quad \lim_{n \to \infty} \sum_{r=1}^{n} \frac{1}{n} e^{r/n} \]

\[ = \int_{0}^{1} e^{x} \, dx = e - 1 \]

So...
AIEEE (now known as IIT-JEE main) - 2005

$$\lim_{n \to \infty} \left[ \frac{1}{n^2} \sec^2 \frac{1}{n} + \frac{2}{n^2} \sec^2 \frac{4}{n} + \ldots + \frac{1}{n^2} \sec^2 \frac{1}{n} \right]$$

(a) \(\frac{1}{2} \cot \theta\)  \hspace{1cm} (b) \(\frac{1}{2} \csc \theta\)

(c) \(\frac{1}{2} \tan \theta\)  \hspace{1cm} (d) \(\tan \theta\)

Solution

(c) : 

$$\lim_{n \to \infty} \frac{1}{n^2} \sec^2 \frac{1}{n} + \frac{2}{n^2} \sec^2 \frac{4}{n} + \ldots + \frac{1}{n^2} \sec^2 \frac{1}{n}$$

$$= \lim_{n \to \infty} \frac{1}{n^2} \sec^2 \frac{1}{n} + \frac{2}{n^2} \sec^2 \frac{4}{n^2} + \ldots + \frac{1}{n^2} \sec^2 \frac{1}{n^2}$$

$$= \lim_{n \to \infty} \sum_{r=1}^{n} \left( \frac{r}{n^2} \right)^2 \left( \sec \left( \frac{r}{n} \right) \right)^2$$

$$= \lim_{n \to \infty} \frac{a^b}{b^2} \left( \frac{1}{n} \right)^2 \left( \frac{a^b}{b^2} \right)^2$$

$$= \int_0^1 x \sec^2 (x^2) \, dx \quad = \frac{1}{2} \tan 1.$$

Type - 10 - Inequality of Definite Integrals

Schwarz-Bunyakovsky Inequality of Definite Integrals

$$\int_a^b f(x)g(x) \, dx \leq \left( \int_a^b f^2(x) \, dx \right)^{\frac{1}{2}} \left( \int_a^b g^2(x) \, dx \right)^{\frac{1}{2}}$$

If \(f(x)\) and \(g(x)\) are integrable on the interval \((a, b)\), then

For example

$$\frac{2}{\pi} \int_0^\pi \sin x \, dx \leq \left( \frac{2}{\pi} \int_0^\pi \sin x \, dx \right)^{\frac{1}{2}}$$

$$\int_0^\pi \sin x \, dx < \sqrt{\frac{\pi}{2}} \left( \int_0^\pi \sin x \, dx \right)^{\frac{1}{2}} = \sqrt{\frac{\pi}{2}}$$
Example - 10.1 -

The value of the integral
\[ \int_{1}^{2} \sqrt{(2x + 3)(3x^2 + 4)} \, dx \] cannot exceed

(a) \( \sqrt{48} \) \hspace{1cm} (b) \( \sqrt{66} \)
(c) \( \sqrt{73} \) \hspace{1cm} (d) none of these

Solution

0 < x < 1 \quad \text{means } x \text{ varies between 0 to 1 where } x \text{ is a fraction. So } x^3 < x^2 \quad \text{Thus } x^3 + 1 < x^2 + 1

\[ \frac{1}{x^3 + 1} > \frac{1}{x^2 + 1} \]

The function \( f(x) = \frac{1}{x^3 + 1} \) is an increasing function on \([0, 1]\). So min \( f(x) = f(0) = 0 \) and max \( f(x) = f(1) = 1/17 \)

Example - 10.2 -

Show that \( 0 \leq \int_{0}^{1} \frac{x}{x^3 + 16} \, dx \leq 1/17 \)

Solution:

0 < x < 1 \quad \text{means } x \text{ varies between 0 to 1 where } x \text{ is a fraction. So } x^3 < x^2 \quad \text{Thus } x^3 + 1 < x^2 + 1

\[ \frac{1}{x^3 + 1} > \frac{1}{x^2 + 1} \]

\[ \int_{0}^{1} \frac{x}{x^3 + 16} \, dx < \int_{0}^{1} \frac{x}{x^3 + 16} \, dx \]

The function \( f(x) = \frac{x}{x^3 + 16} \) is an increasing function on \([0, 1]\). So min \( f(x) = f(0) = 0 \) and max \( f(x) = f(1) = 1/17 \)
Referring to the property - If the function $f(x)$ increases and has a concave graph in the interval $[a, b]$, then

$$(b - a) f(a) < \int_{a}^{b} f(x) \, dx < (b - a) \frac{f(a) + f(b)}{2}$$

Or $\min (b - a) < \text{Integral} < \max (b - a)$

Graph of $y = \frac{x}{x^3 + 16}$ is (The scale of y axis is distorted)

Thus $\min (b - a) = 0 (1 - 0) = 0$ and $\max (b - a) = (1/17) (1 - 0) = 1/17 = 0.058823529$

**AIEEE (now known as IIT-JEE main) - 2005**

If $I_1 = \int_{0}^{1} 2x^2 \, dx$, $I_2 = \int_{0}^{1} 2x^3 \, dx$, $I_3 = \int_{1}^{2} 2x^2 \, dx$ and $I_4 = \int_{1}^{2} 2x^3 \, dx$ then

(a) $I_4 > I_2$  (b) $I_2 > I_1$  (c) $I_3 > I_4$  (d) $I_3 = I_4$

Solution

(a) : For $0 < x < 1$, $x^2 > x^3$ ∴ $2x^2 > 2x^3$

and for $1 < x < 2$, $x^3 > x^2$ ∴ $2x^3 > 2x^2$

i.e. $2x^2 < 2x^3$ ⇒ $I_3 < I_4$

as $2x^2 > 2x^3$

∴ $\int_{0}^{1} 2x^2 \, dx > \int_{0}^{1} 2x^3 \, dx$

∴ $I_1 > I_2$. 
Example - 10.3 -

\[ \int_{0}^{1} \frac{dx}{1 + x^2 + 2x^5} \] lies between

(a) \( \frac{1}{4} \) and 1  
(b) \( \frac{1}{4} \) and \( \frac{1}{2} \)  
(c) \( \frac{1}{2} \) and 1  
(d) none of these

Solution:

In the interval \([0, 1]\), \( f(x) \) is strictly decreasing, therefore, we have,

\[ f(1) \leq f(x) \leq f(0), \text{ i.e., } \frac{1}{4} \leq f(x) \leq 1 \]

\[ \therefore (1 - 0) \left( \frac{1}{4} \right) \leq \int_{0}^{1} f(x) \, dx \leq (1 - 0) \cdot 1 \]

i.e., \( \frac{1}{4} \leq \int_{0}^{1} f(x) \, dx \leq 1 \)

Do it again

\[ \int_{0}^{1} \frac{dx}{1 + x^2 + 2x^5} \] lies between

(a) \( \frac{\pi}{6\sqrt{3}} \) and \( \frac{\pi}{4} \)  
(b) \( \frac{\pi}{3\sqrt{3}} \) and \( \frac{\pi}{2} \)  
(c) \( \frac{\pi}{3\sqrt{3}} \) and \( \frac{\pi}{4} \)  
(d) none of these
Solution:

\[
\begin{align*}
\text{(c). We have,} \\
1 + x^2 + 2x^5 & \geq 1 + x^2 \\
\text{and } 1 + x^2 + 2x^5 & \leq 1 + x^2 + 2x^5 = 1 + 3x^2 \\
\therefore \quad \frac{1}{1 + 3x^2} & \leq \frac{1}{1 + x^2 + 2x^5} \leq \frac{1}{1 + x^2} \\
\Rightarrow \quad \int_{0}^{\frac{\tan^{-1}\sqrt{3}x}{\sqrt{3}}} \frac{dx}{1 + x^2} & \leq \int_{0}^{\frac{\tan^{-1}\sqrt{3}x}{\sqrt{3}}} \frac{dx}{1 + x^2 + 2x^5} \leq \int_{0}^{\frac{\tan^{-1}x}{\sqrt{3}}} \frac{dx}{1 + x^2} \\
\Rightarrow \quad \frac{\pi}{3\sqrt{3}} & \leq \int_{0}^{\frac{\tan^{-1}\sqrt{3}x}{\sqrt{3}}} \frac{dx}{1 + x^2 + 2x^5} \leq \frac{\pi}{4}
\end{align*}
\]

So we see as per the limits given we have to choose the approach.

- 

Inequality of Definite Integrals is explained and discussed at

https://archive.org/details/InequalitiesOfIntegralsUpperLimitAndLowerLimitsCanBeCookedPart1

- 

Example - 10.4 -
Solution:

(b). Let \( f(x) = \frac{1}{\sqrt{4-x^2-x^3}} \)

Since \( 4-x^2 \geq 4-x^2-x^3 \geq 4-2x^2 > 1 \) \( \forall \ x \in [0, 1] \)

\[ \Rightarrow \frac{1}{\sqrt{4-x^2-x^3}} \leq \frac{1}{\sqrt{4-2x^2}} \leq \frac{1}{\sqrt{4-x^2}} \] \( \forall \ x \in [0, 1] \)

\[ \Rightarrow \int_{0}^{1} \frac{dx}{\sqrt{4-x^2-x^3}} \leq \int_{0}^{1} \frac{dx}{\sqrt{4-2x^2}} \leq \int_{0}^{1} \frac{dx}{\sqrt{4-x^2}} \]

\[ \Rightarrow \left| \sin^{-1} \frac{x}{2} \right|_{0}^{1} \leq \left| \frac{dx}{\sqrt{4-x^2-x^3}} \right|_{0}^{1} \leq \left| \sin^{-1} \frac{x}{\sqrt{2}} \right|_{0}^{1} \]

\[ \Rightarrow \frac{\pi}{6} \leq \int_{0}^{1} \frac{dx}{\sqrt{4-x^2-x^3}} \leq \frac{\pi}{4\sqrt{2}} \]
Let \( I = \int_{0}^{1} \frac{\sin x}{\sqrt{1-x}} \, dx \) and \( J = \int_{0}^{1} \frac{\cos x}{\sqrt{1-x}} \, dx \).

Then which one of the following is true?

(a) \( I > \frac{2}{3} \) and \( J < 2 \)  
(b) \( I > \frac{2}{3} \) and \( J > 2 \)  
(c) \( I < \frac{2}{3} \) and \( J < 2 \)  
(d) \( I < \frac{2}{3} \) and \( J > 2 \)

Solution:

(c): In the interval of integration \( \sin x < x \)

\[ I = \int_{0}^{1} \frac{\sin x}{\sqrt{1-x}} \, dx < \int_{0}^{1} \frac{x}{\sqrt{1-x}} \, dx = \int_{0}^{1} \sqrt{x} \, dx = \left[ \frac{2}{3} x^{3/2} \right]_{0}^{1} = \frac{2}{3} \]

\[ \therefore I < \frac{2}{3} \]

Also \( J = \int_{0}^{1} \frac{\cos x}{\sqrt{1-x}} \, dx < \int_{0}^{1} \frac{1}{\sqrt{1-x}} \, dx = \left[ 2\sqrt{x} \right]_{0}^{1} = 2 \)

\[ \therefore J < 2 \]

Example - 10.5 -

If \( I = \int_{1}^{2} \frac{dx}{\sqrt{2x^3 - 9x^2 + 12x + 4}} \), then

(a) \( \frac{1}{2} < I < \frac{1}{3} \)  
(b) \( \frac{1}{4} < I < \frac{1}{3} \)  
(c) \( \frac{1}{4} < I < 1 \)  
(d) none of these

Solution:
Example - 10.6 -

Let $f$ be a real valued function satisfying $f(x) + f(x + 6) = f(x + 3) + f(x + 9)$. Then, $\int_{x}^{x+12} f(t) \, dt$ is

(a) a linear function
(b) an exponential function
(c) a constant function
(d) none of these

Solution:

(c). Given $f(x) + f(x + 6) = f(x + 3) + f(x + 9)$

Put $x = x + 3$, we get

$f(x + 3) + f(x + 9) = f(x + 6) + f(x + 12)$

$\Rightarrow f(x) = f(x + 12)$

Let $g(x) = \int_{x}^{x+12} f(t) \, dt \Rightarrow g(x) = f(x + 12) - f(x) = 0$

$\Rightarrow g(x)$ is a constant function.

Example - 10.7 -
If \( f(x) = x + \int_0^1 (xy^2 - x^2 y) f(y) \, dy \), then \( f(x) \) attains a minimum at

(a) \( x = \frac{8}{9} \)  
(b) \( x = -\frac{8}{9} \)  
(c) \( \frac{9}{8} \)  
(d) \( -\frac{9}{8} \)

Solution:

(d) Given

\[
f(x) = x + x \left[ \int_0^1 y^2 f(y) \, dy - x^2 \int_0^1 y f(y) \, dy \right]
\]

\[
= x \left[ 1 + \int_0^1 y^2 f(y) \, dy \right] - x^2 \left( \int_0^1 y f(y) \, dy \right)
\]

\[\Rightarrow f(x) \text{ is a quadratic expression;}
\]

\[\Rightarrow f(x) = ax + bx^2 \text{ or } f(y) = ay + by^2 \tag{1}
\]

where, \[
\begin{align*}
a &= 1 + \int_0^1 y^2 f(y) \, dy \\
&= 1 + \int_0^1 y^2 (ay + by^2) \, dy
\end{align*}
\]
\[ \begin{align*}
&= 1 + \left( \frac{ay^4}{4} + \frac{by^5}{5} \right) = 1 + \left( \frac{a}{4} + \frac{b}{5} \right) \\
\Rightarrow & \quad 20a = 20 + 5a + 4b \quad \text{or} \quad 15a - 4b = 20 \quad \ldots (2) \\
\text{and,} & \quad b = \int_0^1 y f(y) \, dy = \int_0^1 y \cdot (ay + by^2) \, dy \\
& = \left( \frac{ay^3}{3} + \frac{by^4}{4} \right)_0^1 = \frac{a}{3} + \frac{b}{4} \\
\Rightarrow & \quad 12b = 4a + 3b \quad \text{or} \quad 9b - 4a = 0 \quad \ldots (3) \\
\text{From (2) and (3),} & \quad a = \frac{180}{119}, \quad b = \frac{80}{119} \\
\therefore & \quad \text{Equation (1) reduces to} \\
f(x) = & \quad \frac{80x^2 + 180x}{119} \\
\therefore & \quad f'(x) = \frac{160x + 180}{119} = 0 \Rightarrow x = -\frac{9}{8} \\
\text{and,} & \quad f''(x) = \frac{160}{119} > 0 \Rightarrow f(x) \text{ attains minimum at } x = -\frac{9}{8}
\end{align*} \]
Type - 11 - Finding Area or Volume by applying Definite Integrals

This topic is covered in detail separately, in another e-Book

Putting only one example from AIEEE (now known as IIT-JEE main) - 2008

Area of the plane region bounded by the curves \( x + 2y^2 = 0 \) and \( x + 3y^2 = 1 \) is?

(a) \( \frac{4}{3} \)  (b) \( \frac{5}{3} \)  (c) \( \frac{1}{3} \)  (d) \( \frac{2}{3} \)

Solution:

We have to draw a graph quickly to visualize the intersections and thus the region that is being considered.

(a) : Solution \( x + 2y^2 = 0 \) and \( x + 3y^2 = 1 \) we have
\[ 1 - 3y^2 = -2y^2 \implies y^2 = 1 \implies y = \pm 1 \]

\[ y = -1 \implies x = -2 \]

\[ y = 1 \implies x = -2 \]

The bounded region is as under

The desired area

\[
= 2 \int_{0}^{1} \left[ (1-3y^2) - (-2y^2) \right] dy
\]

\[
= 2 \int_{0}^{1} (1-y^2) dy = 2 \left[ y - \frac{y^3}{3} \right]_{0}^{1}
\]

\[
= 2 \times \frac{2}{3} = \frac{4}{3} \text{ sq. units}
\]
Example - 11.1 -

The area bounded by the lines $y = 2$, $x = 1$, $x = a$ and the curve $y = f(x)$, which cuts the last two lines above the first line for all $a \geq 1$, is equal to

$$\frac{2}{3} \left[ (2a)^{3/2} - 3a + 3 - 2 \sqrt{2} \right].$$

Then, $f(x) =$

(a) $2 \sqrt{2x}$ $x \geq 1$  
(b) $\sqrt{2x}$, $x \geq 1$  
(c) $2 \sqrt{x}$, $x \geq 1$  
(d) none of these

Solution:

(a) We are given

$$\int_{1}^{a} [f(x) - 2] \, dx = \frac{2}{3} \left[ (2a)^{3/2} - 3a + 3 - 2 \sqrt{2} \right].$$

Differentiating w.r.t. $a$, we get

$$f(a) - 2 = \frac{2}{3} \left[ \frac{3}{2} \sqrt{2a} \cdot 2 - 3 \right]$$

$$\Rightarrow f(a) = 2 \sqrt{2a}, a \geq 1$$

$$\therefore f(x) = 2 \sqrt{2x}, x \geq 1.$$ 

This differentiation with respect to $a$ or alpha is discussed below.

Type - 12 - A reverse integration by Partial differentiation by assuming an unknown constant, to be variable. Often written as $\alpha$

Example

$$\int_{0}^{1} x^{b - 1} \, dx$$

The value of the integral $(b > 0)$ is

(a) $\ln |b|$  
(b) $\ln |b + 1|$  
(c) $3 \ln |b|$  
(d) None of these

Answer (d)
Solution:

\[ \int_{1}^{b} x \frac{1 - \frac{1}{x}}{\ln x} \, dx \]

[Considering \( x \) as constant and partially differentiating with respect to \( b \)]

Recall \( \frac{d}{dx} a^x = a^x \ln a \)

So \( \frac{d}{db} x^b = x^b \ln x \)

\[ \int_{0}^{1} x^b \ln x \, dx = \int_{0}^{1} x^b \, dx = \left. \frac{x^{b+1}}{b+1} \right|_{0}^{1} = \frac{1}{b+1} \]

So \( I'(b) = \)

Thus \( I(b) = \int \frac{db}{b+1} = \ln |b+1| + c \)

If \( b = 0 \), then \( I(b) = 0 \) So \( c = 0 \)

Hence \( I(b) = \ln |b+1| \)

**Type - 13 - Problems with Fraction symbol \{ x \}**

\( \{1.3\} = 0.3 \quad \{9.1\} = 0.1 \) The fraction part of the number

**Example - 13.1 -**

The value of \( \int_{-1}^{2} \{[x] - \{x\}\}|dx\) where \([x]\) is the greatest integer less then or equal to \( x \) and \( \{x\} \) is the fractional part of \( x \) is

(a) 7/2 \quad (b) 5/2 \quad (c) 1/2 \quad (d) 3/2

**Ans. (a)**

**Solution**

For any \( x \in \mathbb{R} \), \( x = [x] + \{x\} \) so

\[ [x] - \{x\} = 2 \{x\} - x. \text{ Thus} \]

\[ \int_{-1}^{2} |[x] - \{x\}| \, dx = \int_{-1}^{1} 2 \{x\} - x \, dx + \int_{0}^{1} 2 \{x\} - x \, dx + \int_{1}^{2} 2 \{x\} - x \, dx \]

\[ = \int_{-1}^{0} 2 + x \, dx + \int_{0}^{1} x \, dx + \int_{1}^{2} 2 - x \, dx \]
Example - 13.2 -

If $I_1 = \int_0^a [x] \, dx$ and $I_2 = \int_0^a \{x\} \, dx$, where $[x]$ and $\{x\}$ denote, respectively, the integral and fractional parts of $x$ and $a$ is a positive integer, then

(a) $I_2 = (a-1) I_1$ 
(b) $I_1 = (a-1) I_2$
(c) $I_1 = a I_2$ 
(d) $I_2 = a I_1$.

Solution:

(b). We have, $I_1 = \int_0^a [x] \, dx$

\[
= \int_0^1 0 \, dx + \int_1^2 1 \, dx + \int_2^3 2 \, dx + \cdots + \int_{a-1}^a (a-1) \, dx
\]

\[= 1 + 2 + \cdots + (a-1) = a(a-1) \cdot \frac{1}{2} \quad \quad \quad \quad \quad \quad \text{(1)}
\]

$I_2 = \int_0^a \{x\} \, dx = \int_0^a (x - [x]) \, dx = \int_0^a x \, dx - \int_0^a [x] \, dx$

\[= \frac{x^2}{2} \bigg|_0^a - \frac{a(a-1)}{2} = \frac{a^2}{2} - \frac{a(a-1)}{2} = \frac{a}{2} \quad \quad \quad \quad \quad \text{(2)}
\]

From (1) and (2), we have

\[\frac{I_1}{I_2} = (a-1) \cdot \quad \therefore I_1 = (a-1) I_2.
\]
Example - 13.3 -

The value of \( \int_{0}^{1} (\{2x\} - 1) (\{3x\} - 1) \, dx \), where \( \{ \cdot \} \) denotes the fractional part is,

(a) \( \frac{19}{72} \)  
(b) \( \frac{31}{9} \)  
(c) \( \frac{1}{8} \)  
(d) \( \frac{72}{19} \)

Solution :

\[
(a) \quad \int_{0}^{1/3} (\{2x\} - 1) (\{3x\} - 1) \, dx \\
= \int_{0}^{2/3} (\{2x\} - 1) (\{3x\} - 1) \, dx + \int_{2/3}^{1/3} (\{2x\} - 1) (\{3x\} - 1) \, dx \\
= \int_{0}^{2/3} (2x - 1) (3x - 1) \, dx + \int_{2/3}^{1/3} (2x - 1) (3x - 2) \, dx \\
= \int_{0}^{2/3} (6x^2 - 5x + 1) \, dx + \int_{2/3}^{1/3} (6x^2 - 7x + 2) \, dx \\
+ \int_{1/3}^{3/2} (6x^2 - 10x + 4) \, dx + \int_{3/2}^{2/3} (6x^2 - 12x + 6) \, dx \\
= \frac{19}{72}
\]
Example - 13.4 -

If \([x]\) and \(\{x\}\) denote the integral and fractional parts of \(x\), respectively, then \(\int_0^x \left( x - [x] - \frac{1}{2} \right) \, dx\) is equal to

(a) \(\frac{1}{2} \{x\} (\{x\} - 1)\)  
(b) \(\frac{1}{2} \{x\} (\{x\} + 1)\)  
(c) \(\{x\} (\{x\} - 1)\)  
(d) none of these

Solution:

(a) We have,
\[
\int_0^x \left( x - [x] - \frac{1}{2} \right) \, dx = \int_0^{[x]+[x]} \left( [x] - \frac{1}{2} \right) \, dx
\]
\[
= \int_0^{[x]} \left( [x] - \frac{1}{2} \right) \, dx + \int_{[x]}^{[x]+[x]} \left( [x] - \frac{1}{2} \right) \, dx
\]
\[
= \int_0^{[x]} \left( [x] - \frac{1}{2} \right) \, dx + \int_{[x]}^{[x]} \left( [x] - \frac{1}{2} \right) \, dx
\]
\[
\therefore \{x\} has period 1
\]
\[
= \int_0^{[x]} \left( x - \frac{1}{2} \right) \, dx + \int_{[x]}^{[x]} \left( x - \frac{1}{2} \right) \, dx
\]
\[
= [x] \left[ \frac{x^2}{2} - \frac{x}{2} \right]_0^{[x]} + \left[ \frac{x^2}{2} - \frac{x}{2} \right]_0^{[x]}
\]
\[
= [x] \left( \frac{1}{2} - \frac{1}{2} \right) + \frac{[x]}{2} (\{x\} - 1) = \frac{1}{2} \{x\} (\{x\} - 1)
\]
Type - 14 - Problems that don’t fit into any standard form.

We need to solve rigorously and get the result, specific to the problem.

Such as

The value of the integral \( \int_{0}^{2\pi} e^{\cos \theta} \cos(\sin \theta) d\theta \) is

- (a) \( 0 \)
- (b) \( \pi \)
- (c) \( 2\pi \)
- (d) cannot be determined

Solution:

Here we will use “i” as a tool to solve the problem. Euler Equation \( e^{ix} = \cos x + i \sin x \) helps us to modify the problem.
Example - 14.1 -

If \( I = \int_0^{\pi/2} \cos^n x \sin^n x \, dx = \lambda \int_0^{\pi/2} \sin^n x \, dx \)
then \( \lambda \) equals

(a) \( 2^{-n+1} \)  
(b) \( 2^{-n-1} \)  
(c) \( 2^n \)  
(d) \( 2^{-1} \)

Ans. (c)

Solution \( I = \frac{1}{2^n} \int_0^{\pi/2} (2 \sin x \cos x)^n \, dx \)

\[ = \frac{1}{2^n} \int_0^{\pi/2} \sin^n 2x \, dx \]

Put \( 2x = \theta \), so that

\[ I = \frac{1}{2^n} \int_0^\pi \sin^n \theta \frac{1}{2} \, d\theta \]

\[ = \frac{1}{2^{n+1}} \left[ \int_0^{\pi/2} \left( \sin^n \theta + (\sin (\pi - \theta))^n \right) \, d\theta \right] \]

using \( \int_0^{2a} f(x) \, dx = \int_0^a [f(x) + f(2a - x)] \, dx \)

\( \sin (\pi - \theta) = \sin \theta \) so we can use gamma function for integrating \( \sin^n \theta \)
Practice example

If \( \int_{0}^{\frac{\pi}{1+t}} \sin t \, dt = \alpha \), then the value of the integral

\[
\int_{\frac{4\pi}{4\pi-2}}^{\frac{4\pi}{4\pi+2}} \sin t/2 \, dt
\]

in terms of \( \alpha \) is given by

(a) \( 2\alpha \)  (b) \( -2\alpha \)  (c) \( \alpha \)  (d) \( -\alpha \)

Solution:

\[
\int_{\frac{4\pi}{4\pi-2}}^{\frac{4\pi}{4\pi+2}} \frac{\sin t/2}{4\pi+2-t} \, dt = \frac{1}{2} \int_{\frac{4\pi}{4\pi-2}}^{\frac{4\pi}{4\pi+2}} \frac{\sin t/2}{1+\left(\frac{2\pi-t}{2}\right)} \, dt
\]

\[
= 2 \cdot \frac{1}{2} \int_{0}^{1} \frac{\sin (2\pi-u)}{1+u} \, du
\]

Putting \( 2\pi - \frac{t}{2} = u \) so that \( dt = -2 \, du \)

\[
= -\int_{0}^{1} \frac{\sin u}{1+u} \, du = -\int_{0}^{\frac{\pi}{2}} \frac{\sin t}{1+t} \, dt = -\alpha
\]

An IIT-JEE problem from 70s

If \( I_1 = \int_{0}^{\pi/2} \cos (\sin x) \, dx; I_2 = \int_{0}^{\pi/2} \sin (\cos x) \, dx \) and

\( I_3 = \int_{0}^{\pi/2} \cos x \, dx \), then

(a) \( I_1 > I_3 > I_2 \)  (b) \( I_3 > I_1 > I_2 \)  (c) \( I_1 > I_2 > I_3 \)  (d) \( I_3 > I_2 > I_1 \)
Solution:

(a). We have, $\sin x < x$ for $x > 0$

$\Rightarrow \sin (\cos x) < \cos x$ for $0 < x < \pi/2$

$\Rightarrow \int_0^{\pi/2} \sin (\cos x) \, dx < \int_0^{\pi/2} \cos x \, dx$

$\therefore I_3 > I_2$

Now, $\cos x < \cos \alpha$ if $x > \alpha$ and $x, \alpha \in \left[0, \frac{\pi}{2}\right]$

$\therefore x > \sin x$

$\Rightarrow \cos x < \cos (\sin x)$

$\Rightarrow \int_0^{\pi/2} \cos x \, dx < \int_0^{\pi/2} \cos (\sin x) \, dx$

$\therefore I_3 < I_1$

$\therefore$ from (1) and (2), $I_1 > I_3 > I_2$. \hspace{1cm} \ldots(2)$

Example - 14.2 -

The natural number $n$ (≤ 5) for which

$I_n = \int_0^1 e^x (x - 1)^n \, dx = 16 - 6e$

is

(a) 2 \hspace{1cm} (b) 3

(c) 4 \hspace{1cm} (d) 5

Ans. (b)

Solution: We have $I_0 = \int_0^1 e^x \, dx = e^x \bigg|_0^1 = e - 1$

and for $n \geq 1$,

$I_n = e^x (x - 1)^n \bigg|_0^1 - n \int_0^1 e^x(x - 1)^{n-1} \, dx$

$= -(-1)^n - nI_{n-1}$

$\therefore I_1 = 1 - (1)I_0 = 1 - (e - 1) = 2 - e$

$I_2 = -1 - 2I_1 = -1 - 2(2 - e) = 2e - 5$

and $I_3 = 1 - 3I_2 = 1 - 3(2e - 5) = 16 - 6e$ \hspace{1cm} \text{So } n = 3$
Example - 14.3 -

If \( b > a \) and \( I = \int_{a}^{b} \frac{dx}{\sqrt{(x-a)(b-x)}} \), then \( I \)
equals\( \text{(a) } \pi^2 \) \hspace{1cm} \text{(b) } \pi \hspace{1cm} \text{(c) } 3\pi^2 \hspace{1cm} \text{(d) } 2\pi \)

\( \text{Ans. (b)} \)

\( \text{Solution} \) Put \( t = \frac{1}{2} (x-a+x-b) = x - \frac{1}{2} (a+b) \), so

\( (x-a)(b-x) = (t+c)(c-t) = c^2 - t^2 \)

where \( c = \frac{1}{2} (b-a) \).

Thus,

\( I = \int_{-c}^{c} \frac{dx}{\sqrt{(c^2-t^2)}} \)

\( = 2 \int_{0}^{c} \frac{dx}{\sqrt{(c^2-t^2)}} = 2 \sin^{-1} \left( \frac{t}{c} \right) \bigg|_{0}^{c} \)

\( = 2[\sin^{-1} (1) - 0] = \pi \)
Example 14.4 -

If \( b > a \), and \( I = \int_a^b \frac{x-a}{b-x} \, dx \), then \( I \) equals

(a) \( \frac{\pi}{2} (b-a) \)  
(b) \( \pi (b-a) \)  
(c) \( \pi b \)  
(d) \( 2\pi(b-a) \)

Ans. (a)

Solution  
Put \( b-x = t^2 \), so that

\[
I = \int_{\sqrt{b-a}}^0 \frac{b-t^2-a}{t^2} \, (-2t) \, dt
\]

\[
= 2 \int_0^c \sqrt{c^2-t^2} \, dt \text{ where } c = \sqrt{b-a}
\]

\[
= 2 \left[ \frac{1}{2} t \sqrt{c^2-t^2} + \frac{c^2}{2} \sin^{-1} \left( \frac{t}{c} \right) \right]_0^c
\]

\[
= 0 + c^2 \sin^{-1} (1) - 0 = \frac{\pi}{2} (b-a).
\]

Example 14.5 -

The mean value of the function \( f(x) = \frac{1}{x^2 + x} \) on the interval \( [1, \frac{3}{2}] \) is

(a) \( \log (6/5) \)  
(b) \( 2 \log (6/5) \)  
(c) \( 4 \)  
(d) \( \log 3/5 \)

Ans. (b)

Solution  
Mean value = \( \frac{1}{b-a} \int_a^b f(x) \, dx \)

\[
= \frac{1}{3/2-1} \int_{3/2}^1 \frac{1}{x^2 + x} \, dx = 2 \int_{3/2}^1 \left[ \frac{1}{x} - \frac{1}{x+1} \right] \, dx
\]

\[
= 2 (\log x - \log (x+1)) \bigg|^{3/2}_{1/2} = 2[\log (3/2) - \log (5/2) - (\log 1 - \log 2)]
\]

\[
= 2 \log (6/5).
\]
Example of Max function

The value of \( \int_{-2}^{2} \max \{(1-x), (1+x), 2\} \, dx \) is

(a) 8
(b) -8
(c) 9
(d) -9

Solution

\( \text{(c). For } -2 \leq x \leq -1, \text{ we have } 1-x \geq 2 \) and \( 1-x > 1+x \)

\[ \therefore \max \{(1-x), (1+x), 2\} = 1-x. \]

For \(-1 < x < 1\), we have \( 0 < 1-x < 2 \) and \( 0 < 1+x < 2 \)

\[ \therefore \max \{(1-x), (1+x), 2\} = 2. \]

For \( 1 \leq x \leq 2 \), we have \( 1+x \geq 2 \) and \( 1+x > 1-x \)

\[ \therefore \max \{(1-x), (1+x), 2\} = 1+x. \]

\[ \therefore \int_{-2}^{2} \max \{(1-x), (1+x), 2\} \, dx \]

\[ = \int_{-2}^{-1} (1-x) \, dx + \int_{-1}^{1} 2 \, dx + \int_{1}^{2} (1+x) \, dx \]

\[ = \left[ x - \frac{x^2}{2} \right]_{-2}^{-1} + [2x]_{-1}^{1} + \left[ x + \frac{x^2}{2} \right]_{1}^{2} = 9 \]

Example - 14.6 -

If \( \int_{0}^{100} f(x) \, dx = a \), then

\[ \sum_{r=1}^{100} \left( \int_{0}^{1} f(r-1+x) \, dx \right) \]

(a) 100a
(b) a
(c) 0
(d) 100a
Solution:

\[ \text{(b)} \text{ Let } I = \sum_{r=1}^{100} \left( \int_{0}^{1} f(r-1+x) \, dx \right) \]
\[ \Rightarrow I = \int_{0}^{1} f(x) \, dx + \int_{0}^{1} f(1+x) \, dx + \int_{0}^{1} f(2+x) \, dx \]
\[ + \ldots + \int_{0}^{1} f(99+x) \, dx \]
\[ \Rightarrow \]
\[ I = \int_{0}^{1} f(x) \, dx + \int_{1}^{2} f(x) \, dx + \int_{2}^{3} f(x) \, dx \]
\[ + \ldots + \int_{99}^{100} f(x) \, dx \]
\[ I = \int_{0}^{100} f(x) \, dx = a. \]

Practice example

The value of \( \int_{1}^{16} \tan^{-1} \sqrt{x - 1} \, dx \) is

(a) \( \frac{16\pi}{3} + 2\sqrt{3} \)

(b) \( \frac{4\pi}{3} - 2\sqrt{3} \)

(c) \( \frac{4\pi}{3} + 2\sqrt{3} \)

(d) \( \frac{16\pi}{3} - 2\sqrt{3} \)

Ans. (d)

Solution Integrating by parts, the given integral is equal to

\[ x \tan^{-1} \sqrt{x - 1} \bigg|_{1}^{16} - \int_{1}^{16} x \frac{1}{\sqrt{x} \sqrt{4x + \sqrt{x - 1}}} \, dx \]

\[ = \frac{16\pi}{3} - \frac{1}{4} \int_{1}^{16} \frac{dx}{\sqrt{x}} \frac{1}{\sqrt{x - 1}} \]

\[ = \frac{16\pi}{3} - \frac{1}{4} \int_{1}^{\sqrt{3}} \frac{4t(1+t^2)}{t} \, dt (\sqrt{x} = 1 + t^2) \]

\[ = \frac{16\pi}{3} - (\sqrt{3} + \sqrt{3})(1 + 1) \]

\[ = \frac{16\pi}{3} - 2\sqrt{3} \]
Practice Example

For any $t \in \mathbb{R}$ and $f$ a continuous function, let

$$I_1 = \int_{\sin^2 t}^{1+\cos^2 t} f(x(2-x)) \, dx$$

and

$$I_2 = \int_{\sin^2 t}^{1+\cos^2 t} f(x(2-x)) \, dx$$

then $I_1/I_2$ is equal to

(a) 2
(b) 1
(c) 4
(d) none of these

Ans. (b)

Solution

$$I_1 = \int_{\sin^2 t}^{1+\cos^2 t} \frac{(2-x)f((2-x)(2-(2-x)))}{2} \, dx$$

$$= \int_{\sin^2 t}^{1+\cos^2 t} (2-x)f(x(2-x)) \, dx$$

$$= 2 \int_{\sin^2 t}^{1+\cos^2 t} f(x(2-x)) \, dx - \int_{\sin^2 t}^{1+\cos^2 t} xf(x(2-x)) \, dx = 2I_2 - I_1$$

Therefore, $2I_1 = 2I_2$ and so $I_1/I_2 = 1$.

Practice Example

If $\int_{0}^{\infty} e^{-ax} \, dx = \frac{1}{a}$, then $\int_{0}^{\infty} x^n e^{-ax} \, dx$ is

(a) $\frac{(-1)^n}{a^{n+1}}$
(b) $\frac{(-1)^n (n-1)!}{a^n}$
(c) $\frac{n!}{a^{n+1}}$
(d) none of these

Solution:

(c). Let $I_n = \int_{0}^{\infty} x^n e^{-ax} \, dx$

$$= \left[ x^n e^{-ax} \right]_{0}^{\infty} - \int_{0}^{\infty} nx^{n-1} e^{-ax} \, dx$$

$$= - \frac{1}{a} \lim_{x \to \infty} x^n e^{-ax} + \frac{n}{a} I_{n-1}$$

$$\therefore I_n = \frac{n}{a} I_{n-1}$$

$$= \frac{n}{a} \cdot \frac{n-1}{a} I_{n-2}$$

$$= \frac{n(n-1)(n-2)}{a^3} I_{n-3}$$
\[ \frac{n!}{a^n} \int_0^\infty e^{-ax} \, dx = \frac{n!}{a^{n+1}} \]

**Practice Example**

The value of \( I = \int_{-\pi/2}^{\pi/2} \cos x \cos^3 x \, dx \) is

\( \begin{align*}
(a) & \ 0 \\
(b) & \ 2/3 \\
(c) & \ 4/3 \\
(d) & \ 1/3
\end{align*} \)

**Solution**

\( I = \int_{-\pi/2}^{\pi/2} \cos x \cos^3 x \, dx \) (the integrand is an even function)

\[ I = 2 \int_0^{\pi/2} \cos x \sin x \, dx = \frac{4}{3} \cos x \left|_0^{\pi/2} \right. = \frac{4}{3} \]

**Practice Example**

The value of \( \int_1^a [x]f'(x) \, dx \), \( a > 1 \), where \([x] \) denotes the greatest integer not exceeding \( x \) is

\( \begin{align*}
(a) & \ af([a]) - \{f(1) + f(2) + \ldots + f([a])\} \\
(b) & \ af(a) - \{f(1) + f(2) + \ldots + f([a])\} \\
(c) & \ [a]f(a) - \{f(1) + f(2) + \ldots + f([a])\} \\
(d) & \ [a]f([a]) - \{f(1) + f(2) + \ldots + f(a)\}
\end{align*} \)
Solution:

\[ \int_{1}^{a} x f'(x) \, dx = \int_{1}^{a} f'(x) \, dx + \frac{3}{2} \int_{1}^{a} f'(x) \, dx + \frac{4}{3} \int_{1}^{a} f'(x) \, dx + \ldots + \]
\[ \int_{[a]}^{[a]} (f(a)-f([a])) \, dx \]
\[ = (f(2)-f(1)) + 2(f(3)-f(2)) + 3(f(4)-f(3)) + \ldots + [a] (f(a)-f([a])) \]
\[ = [a] f(a) - \{ f(1)+f(2)+f(3)+\ldots+f([a]) \}. \]

Practice Example

The value of \( \int_{-\pi}^{\pi} \log (\sec \theta - \tan \theta) \, d\theta \) is

(a) 1  (b) 0  (c) 2  (d) none of these

\[ \text{Ans. (b)} \]

\[ I = \int_{-\pi}^{\pi} \log (\sec \theta - \tan \theta) \, d\theta \]
\[ = \int_{-\pi}^{\pi} \log (\sec (2\pi - \theta) - \tan (2\pi - \theta)) \, d\theta \]
\[ = \int_{-\pi}^{\pi} \log (\sec \theta + \tan \theta) \, d\theta. \]

Thus \( 2I = \int_{-\pi}^{\pi} [\log (\sec \theta - \tan \theta) + \log (\sec \theta + \tan \theta)] \, d\theta \)
\[ = \int_{-\pi}^{\pi} \log (\sec^2 \theta - \tan^2 \theta) \, d\theta = \int_{-\pi}^{\pi} \log 1 \, d\theta = 0. \]
Practice Example

\[ \int_0^{2\pi} \frac{1}{1 + e^{i\sin x}} \, dx \]

Let \( I = \int_0^{2\pi} \frac{1}{1 + e^{i\sin x}} \, dx \)

Also, \( I = \int_0^{2\pi} \frac{1}{1 + e^{i\sin (2\pi - x)}} \, dx \)

\[ = \int_0^{2\pi} \frac{1}{1 + e^{-i\sin x}} \, dx \]
\[ = \int_0^{2\pi} \frac{e^{i\sin x}}{e^{i\sin x} + 1} \, dx \]

Adding (i) and (ii), we have

\[ 2I = \int_0^{2\pi} \frac{1}{1 + e^{i\sin x}} \, dx + \int_0^{2\pi} \frac{e^{i\sin x}}{e^{i\sin x} + 1} \, dx \]
\[ = \left[ 2 \int_0^{2\pi} \frac{1}{e^{i\sin x} + 1} \, dx \right] \]
\[ = 2 \int_0^{2\pi} \frac{1}{e^{i\sin x} + 1} \, dx = \int_0^{2\pi} \frac{1}{1} \, dx \]
\[ = 2\pi \]

Solve a Simple Problem

\[ \int \frac{3x + 1}{2x^2 + x + 1} \, dx = \int \left( \frac{3}{4} \frac{4x + 1}{2x^2 + x + 1} + \frac{1}{4} \right) \, dx \]

\[ = \frac{3}{4} \int \left( \frac{4x + 1}{2x^2 + x + 1} \right) \, dx + \frac{1}{8} \int \frac{dx}{\left( \frac{x}{2} + \frac{1}{2} \right)} \]
\[ = \frac{3}{4} \log (2x^2 + x + 1) + \frac{1}{2\sqrt{7}} \tan^{-1} \frac{4x + 1}{\sqrt{7}} + C \]
A routine problem asked in several exams

\[
\int_0^\sqrt{3} \frac{1}{1+x^2} \sin^{-1}\left(\frac{2x}{1+x^2}\right) \, dx =
\]

(a) \(\frac{7}{72}\pi^2\)  
(b) \(\frac{3}{42}\pi^2\)  
(c) \(\frac{17}{72}\pi^2\)  
(d) none of these

Solution:

(a). Let \(I = \int_0^\sqrt{3} \frac{1}{1+x^2} \sin^{-1}\left(\frac{2x}{1+x^2}\right) \, dx\)

Now, \(\sin^{-1}\left(\frac{2x}{1+x^2}\right) = \begin{cases} 2 \tan^{-1}x, & \text{if } -1 \leq x \leq 1 \\ \pi - 2 \tan^{-1}x, & \text{if } x > 1 \end{cases}\)

\[I = \int_0^1 \frac{1}{1+x^2} \sin^{-1}\left(\frac{2x}{1+x^2}\right) \, dx\]

\[= \int_0^1 \frac{1}{1+x^2} \, dx + \int_1^\sqrt{3} \frac{\pi - 2 \tan^{-1}x}{1+x^2} \, dx\]

\[= 2 \int_0^1 \tan^{-1}x \, dx + \pi \int_1^\sqrt{3} \frac{1}{1+x^2} \, dx\]

\[= 2 \left[ \frac{\pi}{4} \tan^{-1}x \right]_0^1 + \pi \left[ \frac{1}{1+x^2} \right]_1^\sqrt{3}\]

\[= \frac{\pi}{4} + \pi - 2 \int_1^\sqrt{3} \tan^{-1}x \, dx\]

\[= 2 \left[ \frac{\pi}{4} + \frac{\pi}{4} \right] - 2 \int_1^\sqrt{3} t \, dt\]

\[= \frac{\pi}{2} - \frac{\pi}{2}\]
\[
\begin{align*}
2 \left( \frac{r^2}{2} \right)^{\pi/4} + \pi \left( \tan^{-1} \frac{\sqrt{3}}{r} - \tan^{-1} 1 \right) &- 2 \left( \frac{r^2}{2} \right)^{\pi/4} \\
\frac{\pi^2}{16} + \pi \left( \frac{\pi}{3} - \frac{\pi}{4} \right) - \left( \frac{\pi^2}{9} - \frac{\pi^2}{16} \right) &= \frac{7}{72} \pi^2.
\end{align*}
\]

Solve a problem

\[
\int \frac{x}{(1-x)^{1/3} - (1-x)^{1/2}}\,dx \quad \text{[The LCM of 2 and 3 is 6]}
\]

Hence, substitute \(1-x = u^6\) Then, \(dx = -6u^5\,du\)

\[
\Rightarrow I = \int \frac{1-u^6}{u^2 - u^3}(-6u^5\,du) = -6\int \frac{1-u^6}{1-u^3}\,du
\]

\[
= -6\int \left(1 + u + u^2 + u^3 + u^4 + u^5\right) u^3\,du
\]

\[
= -6 \left( \frac{1}{4} u^4 + \frac{1}{5} u^5 + \frac{1}{6} u^6 + \frac{1}{7} u^7 + \frac{1}{8} u^8 + \frac{1}{9} u^9 \right) + c
\]

Solve a Problem

The value of \(\int_0^1 \frac{x}{x^2 + 16}\,dx\) lies in the interval \([a, b]\). The smallest such interval is

(a) \([0, 1]\)  \quad (b) \([0, \frac{1}{7}]\)

(c) \([0, \frac{1}{17}]\)  \quad (d) none of these
Solution:

(c). Let \( f(x) = \frac{x}{x^2 + 16} \)

\[ f'(x) = \frac{(x^2 + 16) \cdot 1 - x \cdot 2x}{(x^2 + 16)^2} \]

\[ = \frac{16 - x^2}{(x^2 + 16)^2} \geq 0 \]

\[ \Rightarrow 16 \geq x^2 \Rightarrow x^2 \leq 16 \Rightarrow -4 \leq x \leq 4 \]

\[ \Rightarrow f(x) \text{ is monotonic increasing in } [-4, 4]. \text{ Since } [0, 1], \subseteq [-4, 4] \]

\[ \Rightarrow f(x) \text{ is monotonic increasing in } [0, 1] \]

\[ M = \frac{1}{1+16} = \frac{1}{17} \text{ and } m = \frac{0}{0+16} = 0 \]

\[ \Rightarrow m (1 - 0) \leq \int_{0}^{1} f(x) \, dx \leq M (1 - 0) \]

\[ \Rightarrow 0 (1 - 0) \leq \int_{0}^{1} \frac{x}{x^2 + 16} \, dx \leq \frac{1}{17} (1 - 0) \]

\[ \Rightarrow 0 \leq \int_{0}^{1} \frac{x \, dx}{x^2 + 16} \leq \frac{1}{17} \]

\[ \Rightarrow \text{ The smallest such interval is } [0, \frac{1}{17}] \]
Solve a Problem

Evaluate \[ \int \cos 2x \log(1 + \tan x) \, dx. \]

**Solution:**

Integrating by parts taking \( \cos 2x \) as the 2nd function, the given integral

\[
= \{\log(1 + \tan x)\} \cdot \frac{\sin 2x}{2} - \int \frac{\sec^2 x}{1 + \tan x} \cdot \frac{\sin 2x}{2} \, dx
\]

\[
= \frac{1}{2} \sin 2x \log(1 + \tan x) - \int \frac{\sin x}{\sin x + \cos x} \, dx.
\]

Now \( \int \frac{\sin x \, dx}{\sin x + \cos x} \)

\[
= \frac{1}{2} \int \frac{(\sin x + \cos x) - (\cos x - \sin x)}{\sin x + \cos x} \, dx,
\]

\[
= \frac{1}{2} \int \left[ 1 - \frac{\cos x - \sin x}{\sin x + \cos x} \right] \, dx = \frac{1}{2} \left[ x - \log(\sin x + \cos x) \right].
\]

Hence the given integral

\[
= \frac{1}{2} \sin 2x \log(1 + \tan x) - \frac{1}{2} \left[ x - \log(\sin x + \cos x) \right].
\]

Recall how to integrate Linear \( x \) root Quadratic in denominator

Find the value of the integral \( \int \frac{dx}{(x+1)\sqrt{1+2x-x^2}} \)

Putting \( x + 1 = \frac{1}{t} \), so that \( dx = -\frac{1}{t^2} \, dt \), \( x = \frac{1-t}{t} \) and

\[
(1+2x-x^2) = 1 + 2 \left( \frac{1-t}{t} \right) - \frac{(1-t)^2}{t^2} = \frac{2}{t^2} \left[ \left( \frac{1}{\sqrt{2}} \right)^2 - (t-1)^2 \right],
\]
we get the value of the given integral transformed as
Remember -

\[
\int \frac{-\frac{1}{t^2}}{\sqrt{\left(\frac{1}{\sqrt{2}}\right)^2 - (t-1)^2}} \, \frac{dt}{t} = -\frac{1}{\sqrt{2}} \sin^{-1} \left(\frac{t-1}{\frac{1}{\sqrt{2}}}\right) + C = \frac{1}{\sqrt{2}} \sin^{-1} \left(\frac{\sqrt{2}x}{x+1}\right) + C
\]

For the form \( \int \frac{dx}{(Ax+B)^r \sqrt{(ax^2 + bx + c)}} \) where \( r \) is a positive integer, we can substitute \( Ax + B = \frac{1}{t} \)

\[
\int \frac{dx}{(Ax+B) \sqrt{(ax+b)}} = \int \frac{dx}{(Ax^2 + Bx + C) \sqrt{(ax+b)}}
\]

But for \( \int \frac{dx}{(Ax^2 + Bx + C) \sqrt{(ax+b)}} \) we have to substitute \( ax + b = t^2 \)

So the Linear expression that is inside the root will be substituted.

**Another advanced example**

**Example**

Evaluate \( \int \frac{dx}{x \sqrt{(1 + x^n)}} \)

Make the substitution \( 1 + x^n = t^2 \) or \( x^n = (t^2 - 1) \), so that \( n \cdot x^{n-1} \cdot dx = 2t \cdot dt \), we get

\[
\int \frac{2t \cdot dt}{n \cdot x \cdot x^{n-1} \cdot t} = \frac{2}{n} \int \frac{dt}{(t^2 - 1)} = \frac{1}{n} \ln \left| \frac{t-1}{t+1} \right| = \frac{1}{n} \ln \left| \frac{\sqrt{(1 + x^n)} - 1}{\sqrt{(1 + x^n)} + 1} \right| + C
\]
Similarly

The value of integral \( \int \frac{dx}{x \sqrt{1 - x^3}} \) is given by

(a) \( \frac{1}{3} \log \left| \frac{\sqrt{1 - x^3} + 1}{\sqrt{1 - x^3} - 1} \right| + C \)

(b) \( \frac{1}{3} \log \left| \frac{\sqrt{1 - x^3} - 1}{\sqrt{1 - x^3} + 1} \right| + C \)

(c) \( \frac{2}{3} \log \left| \frac{1}{\sqrt{1 - x^3}} \right| + C \)

(d) \( \frac{1}{3} \log \left| 1 - x^3 \right| + C \)

An. (b)

Solution

Put \( 1 - x^3 = t^2 \). Then \(-3x^2 dx = 2t \, dt \) and the integral becomes

\[
- \frac{1}{3} \int \frac{-3x^2 dx}{x^3 \sqrt{1 - x^3}} = - \frac{1}{3} \int \frac{2t \, dt}{(1 - t^2)^{3/2}} = \frac{2}{3} \int \frac{dt}{t^2 - 1}
\]

\[
= \frac{2}{3} \left( \frac{1}{2} \log \left| \frac{t - 1}{t + 1} \right| \right) + C = \frac{1}{3} \log \left| \frac{\sqrt{1 - x^3} - 1}{\sqrt{1 - x^3} + 1} \right| + C
\]

Solve a Problem

\( \int \sqrt{\sec x - 1} \, dx \) is equal to

(a) \( 2 \log \left( \cos \frac{x}{2} + \sqrt{\cos^2 \frac{x}{2} - \frac{1}{2}} \right) + C \)

(b) \( \log \left( \cos \frac{x}{2} + \sqrt{\cos^2 \frac{x}{2} - \frac{1}{2}} \right) + C \)

(c) \( -2 \log \left( \cos \frac{x}{2} + \sqrt{\cos^2 \frac{x}{2} - \frac{1}{2}} \right) + C \)

(d) none of these
(c). \[ \int \sqrt{\sec x - 1} \, dx = \int \sqrt{\frac{1 - \cos x}{\cos x}} \, dx \]

\[ = \sqrt{2} \int \frac{\sin x}{\sqrt{2 \cos^2 \frac{x}{2} - 1}} \, dx = -2 \int \frac{dz}{\sqrt{z^2 - \left(\frac{\sqrt{2}}{2}\right)^2}} \]

\[ = -2 \log \left[ z + \sqrt{z^2 - \left(\frac{\sqrt{2}}{2}\right)^2} \right] + C \]

\[ = -2 \log \left( \cos \frac{x}{2} + \sqrt{\cos^2 \frac{x}{2} - \frac{1}{2}} \right) + C \]

Solve a tricky problem

Solve \[ \int \frac{\sqrt{\tan x}}{\sin x \cos x} \, dx \]

Solution:

\[ \int \frac{\sqrt{\tan x}}{\sin x \cos x} \, dx \]

\[ = \int \frac{\sin x}{\sqrt{\cos x \sin^2 x \cos^2 x}} \, dx \]

\[ = \int \frac{1}{\sqrt{\sin x \cos^3 x}} \, dx \]

\[ = \int \frac{1}{\sin^3 x \cot^3 x} \, dx \]

\[ = - \int \csc^2 x \cot^{-3/2} x \, dx \]

\[ = \frac{2}{\cot x} + C \]
Solve another problem

\[ I = \int \sqrt{1 + \csc x} \, dx \]

\[ = \int \sqrt{\frac{1}{\sin x} + 1} \, dx = \int \sqrt{\frac{\sin x + 1}{\sin x}} \, dx \]

\[ = \int \frac{(1 + \sin x)(1 - \sin x)}{\sin x (1 - \sin x)} \, dx \quad \text{[On rationalization]} \]

\[ = \int \frac{1 - \sin^2 x}{\sin x - \sin^2 x} \, dx \quad \text{[} \therefore (a + b)(a - b) = a^2 - b^2 \text{]} \]

\[ = \int \frac{\cos x}{\sin x - \sin^2 x} \, dx \quad \text{[} \therefore \sin^2 A + \cos^2 A = 1 \text{]} \]

\[ \sin x = z \Rightarrow \cos x \, dz = dz \]

\[ I = \int \frac{1}{\sqrt{z^2 - z^2}} \, dz = \int \frac{1}{\sqrt{-z^2}} \, dz \]

\[ = \int \frac{1}{\sqrt{z^2}} \, dz \quad \text{[Add and subtract} \frac{1}{4} \text{to the denom.]} \]

\[ = \int \frac{1}{\sqrt{\left(\frac{1}{2}\right)^2 - (z - \frac{1}{2})^2}} \, dz \]

\[ \left(z - \frac{1}{2}\right) = y \Rightarrow dz = dy \]

\[ I = \int \frac{1}{\sqrt{(1/2)^2 - y^2}} \, dy \quad \text{[By using} \int \frac{1}{\sqrt{a^2 - x^2}} \, dx = \sin^{-1} \left( \frac{x}{a} \right) + c \text{]} \]

\[ = \sin^{-1} \left( \frac{y}{1/2} \right) + c \]

\[ = \sin^{-1} \left( \frac{z - 1/2}{1/2} \right) + c \quad \text{[} \therefore y = z - 1/2 \text{]} \]
Solve another Integral

\[ I = \int \frac{1+x}{x} \cdot dx \]

\[ = \int \frac{1+x}{x} \cdot \frac{1+x}{1+x} \cdot dx \quad \text{[Multiply and divided by \((1+x)\)]} \]

\[ = \int \frac{(1+x)^2}{x(1+x)} \cdot dx = \int \frac{1+x}{\sqrt{x+x^2}} \cdot dx \]

Let us write:

\[ 1 + x = \lambda \cdot \frac{d}{dx} (x + x^2) + \mu \]

\[ \Rightarrow 1 + x = \lambda (1 + 2x) + \mu \]

\[ \Rightarrow 1 + x = 2\lambda x + \lambda + \mu \]

Comparing the coefficients of \(x\) and the constant terms, we have

\[ 1 = 2\lambda \Rightarrow \lambda = \frac{1}{2} \]

and

\[ 1 = \lambda + \mu \Rightarrow \mu = 1 - \lambda = 1 - \frac{1}{2} = \frac{1}{2}. \]

Putting the values of \(\lambda\) and \(\mu\) in \((1)\),

\[ 1 + x = \frac{1}{2} (1+2x) + \frac{1}{2}. \]

\[ \therefore \quad I = \int \frac{\frac{1}{2}(1+2x) + \frac{1}{2}}{\sqrt{x+x^2}} \cdot dx \]

\[ = \frac{1}{2} \int \frac{1+2x}{\sqrt{x+x^2}} \cdot dx + \frac{1}{2} \int \frac{1}{\sqrt{x+x^2}} \cdot dx \]

\[ \Rightarrow \quad I = \frac{1}{2} I_1 + \frac{1}{2} I_2 \quad \text{...(2)} \]

Now

\[ I_1 = \int \frac{1+2x}{\sqrt{x+x^2}} \cdot dx \]

Put \(x + x^2 = z \Rightarrow (1 + 2x) \cdot dx = dz \)

\[ \therefore \quad I_1 = \int \frac{1}{\sqrt{z}} \cdot dz = \int z^{-\frac{1}{2}} \cdot dz = \frac{z^{\frac{1}{2}}}{\frac{1}{2} + 1} + c_1 = 2\sqrt{z} + c_1 \]

\[ = 2\sqrt{x+x^2} + c_1 \quad \text{...(3)} \]

and

\[ I_2 = \int \frac{1}{\sqrt{x+x^2}} \cdot dx \]
\[ \int \frac{1}{\sqrt{x^2 + x + \left(\frac{1}{4}\right)} - \frac{1}{4}} \, dx \]

Add and subtract \( \frac{1}{4} \) to the denom.

\[ \int \frac{1}{\sqrt{x + \left(\frac{1}{2}\right)^2} - \left(\frac{1}{2}\right)^2} \, dx \]

Put \( x + \frac{1}{2} = z \Rightarrow dx = dz \)

\[ I_2 = \int \frac{1}{\sqrt{z^2 - \left(\frac{1}{2}\right)^2}} \, dz \]

By using \( \int \frac{1}{\sqrt{x^2 - a^2}} \, dx = \log \left| x + \sqrt{x^2 - a^2} \right| + c \)

\[ = \log \left| z + \sqrt{z^2 - \left(\frac{1}{2}\right)^2} \right| + c_2 = \log \left| \left(x + \frac{1}{2}\right) + \sqrt{x + \left(\frac{1}{2}\right)^2 - \frac{1}{4}} \right| + c_2 \]

\[ = \log \left| x + \frac{1}{2} \right| + \sqrt{x^2 + x} + c_2 \]

From equation (2),

\[ I = \frac{1}{2} I_1 + \frac{1}{2} I_2 \]

[Using (3) and (4)]
Solve another problem

\[ I = \int \frac{ax^3 + bx}{x^4 + c^2} \, dx = \int \frac{ax^3}{x^4 + c^2} \, dx + \int \frac{bx}{x^4 + c^2} \, dx \]

\[ = a \int \frac{x^3}{x^4 + c^2} \, dx + b \int \frac{x}{x^4 + c^2} \, dx \]

\[ \Rightarrow I = a I_1 + b I_2 \]  \hspace{1cm} \text{...(1)}

Now \[ I_1 = \int \frac{x^3}{x^4 + c^2} \, dx \]

\[ = \frac{1}{4} \int \frac{4x^3}{x^4 + c^2} \, dx \quad \text{[Multiply and divided by 4]} \]

\[ = \frac{1}{4} \log |x^4 + c^2| + c_1 \quad \text{...(2)} \]

\[ \therefore \int \frac{f'(x)}{f(x)} \, dx = \log |f(x)| + c \]

and \[ I_2 = \int \frac{x}{x^4 + c^2} \, dx \]

\[ = \frac{1}{2} \int \frac{2x}{(x^2)^2 + c^2} \, dx \quad \text{[Multiply and divided by 2]} \]

Put \[ x^2 = z \Rightarrow 2x \, dx = dz \]

\[ = \frac{1}{2} \int \frac{1}{z^2 + c^2} \, dz \quad \text{[By using} \int \frac{1}{x^2 + a^2} \, dx = \frac{1}{a} \tan^{-1} \frac{x}{a} + c] \]
Solve Integration root linear plus root linear in denominator

If \( I = \int \frac{dx}{\sqrt{2x+3} + \sqrt{x+2}} \), then \( I \) equals

(a) \( 2(u - v) + \log \left| \frac{u - 1}{u + 1} \right| + \log \left| \frac{v - 1}{v + 1} \right| + C \)

\( u = \sqrt{2x+3}, \ v = \sqrt{x+2} \)

(b) \( \log \left| \frac{\sqrt{x+2} + \sqrt{2x+3}}{\sqrt{x+2} - \sqrt{2x+3}} \right| + C \)

(c) \( \log \left( \sqrt{x+2} + \sqrt{2x+3} \right) + C \)

(d) is transcendental function in \( u \) and \( v \), \( u = \sqrt{2x+3}, \ v = \sqrt{x+2} \)

Ans. (a), (d)
\[ I = \int \frac{\sqrt{2x + 3} - \sqrt{x + 2}}{x + 1} \, dx \]
\[ = I_1 - I_2 \]

where \( I_1 = \int \frac{\sqrt{2x + 3}}{x + 1} \, dx \) and \( I_2 = \int \frac{\sqrt{x + 2}}{x + 1} \, dx \)

Put \( 2x + 3 = t^2 \) in \( I_1 \), so that
\[ I_1 = \int \frac{2t \cdot \frac{dt}{2}}{t^2 - 1} = 2 \int \frac{1 + \frac{1}{t^2 - 1}}{t^2 - 1} \, dt \]
\[ = 2 \left[ t + \frac{1}{2} \log \left| \frac{t - 1}{t + 1} \right| \right] \]

In \( I_2 \), put \( x + 2 = y^2 \), so that
\[ I_2 = \int \frac{2y^2}{y^2 - 1} \, dy = 2y + \log \left| \frac{y - 1}{y + 1} \right| \]

Thus,
\[ I = 2 \left( \sqrt{2x + 3} - \sqrt{x + 2} \right) + \log \left| \frac{\sqrt{2x + 3} - 1}{\sqrt{2x + 3} + 1} \right| + C \]
Solve another Problem

\[ \text{Evaluate } \int \frac{\sin 2x \, dx}{(a + b \cos x)^2} \]

**Solution:**

We have \( I = \int \frac{\sin 2x \, dx}{(a + b \cos x)^2} = 2 \int \frac{\sin x \cos x \, dx}{(a + b \cos x)^2} \)

Now put \( a + b \cos x = t \)
so that \( -b \sin x \, dx = dt \).

Also \( \cos x = \frac{(t-a)}{b} \).

\[ \therefore I = -\frac{2}{b} \int \frac{(t-a)/b}{t^2} \, dt = -\frac{2}{b^2} \int \left[ \frac{t}{t^2} - \frac{a}{t^2} \right] \, dt \]

\[ = -\frac{2}{b^2} \int \left[ \frac{1}{t} - \frac{a}{t^2} \right] \, dt = -\frac{2}{b^2} \left[ \log t + \frac{a}{t} \right] \]

\[ = -\frac{2}{b^2} \left[ \log(a + b \cos x) + \frac{a}{a + b \cos x} \right]. \]
A special Integral

\[ \int \frac{(1-\sqrt{1+x+x^2})^2}{x^2 \sqrt{1+x+x^2}} \, dx \]

Here we set \( \sqrt{1+x+x^2} = xt + 1 \), so that

\[ x = \frac{2t-1}{1-t^2}, \quad dx = \frac{2t^2-2t+2}{(1-t^2)^2} \, dt \] and

\[ (1-\sqrt{1+x+x^2}) = \frac{-2t^2+t}{(1-t^2)} \]

Substitution of these values in the given integral transforms the problem in the form

\[ \int \frac{(-2t^2+t)^2 (1-t^2)^2 (1-t^2) (2t^2-2t+2)}{(1-t^2)^2 (2t-1)^2 (t^2-t+1)(1-t^2)^2} \, dt \]

\[ = 2 \int \frac{t^2}{1-t^2} \, dt = -2t + \ln \left| \frac{1+t}{1-t} \right| + C \]
An advanced example

\[ I = \int \frac{(x+1)}{x(1+xe^x)^2} \, dx \]

\[ I = \int \frac{e^x(x+1)}{x e^x (1+xe^x)^2} \, dx \]

put \( 1 + xe^x = t, \ (xe^x + e^x) \, dx = dt \)

\[ I = \int \frac{dt}{(t-1)t^2} = \int \left( \frac{1}{1-t} + \frac{1}{t} + \frac{1}{t^2} \right) dt \]

\[ = -\log |1-t| + \log |t| - \frac{1}{t} + C = \log \left| \frac{t}{1-t} \right| - \frac{1}{t} + C \]

\[ = \log \left| \frac{1+xe^x}{-xe^x} \right| - \frac{1}{1+xe^x} + C = \log \left( \frac{1+xe^x}{xe^x} \right) - \frac{1}{1+xe^x} + C \]
Practice Example

Let \( f(x) \) be a function defined by \( f(x) = \int_1^x (x^2 - 3x + 2) \, dx \), \( 1 \leq x \leq 3 \), then the range of \( f(x) \) is

(a) \( \left[ -\frac{1}{4}, 2 \right] \)  
(b) \( \left[ -\frac{1}{4}, 4 \right] \)  
(c) \( [0, 2] \)  
(d) none of these

Solution :

(a). We have,
\[
f'(x) = x (x^2 - 3x + 2) = x (x - 1) (x - 2)
\]
Clearly, \( f'(x) \leq 0 \) in \( 1 \leq x \leq 2 \) and \( f'(x) \geq 0 \) in \( 2 \leq x \leq 3 \).
\[
\therefore\quad f'(x) \text{ is monotonic decreasing in } [1, 2] \text{ and monotonic increasing in } [2, 3] .
\]
\[
\therefore\quad \text{Min. } f(x) = f(2) = \int_1^2 x (x^2 - 3x + 2) \, dx
\]
\[
= \left[ \frac{x^4}{4} - x^3 + x^2 \right]_1^2 = \frac{-1}{4}
\]
Max. \( f(x) \) = the greatest among \( f(1), f(3) \)

Now, \( f(1) = \int_1^1 x (x^2 - 3x + 2) \, dx = 0 \)

\[ f(3) = \int_1^3 x (x^2 - 3x + 2) \, dx \]
\[
= \left[ \frac{x^4}{4} - x^3 + 2 \right]_1^3 = 2. \quad \therefore\quad \text{Max. } f(x) = 2
\]

Hence, Range = \( \left[ -\frac{1}{4}, 2 \right] \)
Practice Example

\[
\int_{-2\pi}^{5\pi} \cot^{-1}(\tan x) \, dx
\]

\[\begin{align*}
(a) \quad 7\pi^2 & \\
(b) \quad \frac{7\pi^2}{2} & \\
(c) \quad 0 & \\
(d) \quad \frac{3\pi^2}{2} & 
\end{align*}\]

Solution:

\[(b) \text{ Let } I = \int_{-2\pi}^{5\pi} \cot^{-1}(\tan x) \, dx\]

\[= 7 \int_{0}^{\pi} \cot^{-1}(\cot(\pi/2 - x)) \, dx \quad \text{(i)}\]

\[\text{(i) Period is } \pi\]

Since \(\cot^{-1}(\cot x) = \begin{cases} x, & 0 < x < \pi/2 \\ \pi + x, & \pi/2 < x < \pi \end{cases}\)

\[\therefore I = 7 \left\{ \int_{0}^{\pi/2} \left( \frac{\pi}{2} - x \right) \, dx + \int_{\pi/2}^{\pi} \left( \frac{\pi}{2} + x - \pi \right) \, dx \right\}\]

\[= 7 \left\{ \left[ \frac{\pi^2}{8} - \frac{\pi^2}{2} \right] + \left[ \frac{3\pi^2}{4} - \frac{\pi^2}{2} - \frac{3\pi^2}{8} + \frac{\pi^2}{8} \right] \right\}\]

\[= 7 \left\{ \frac{\pi^2}{4} - \frac{\pi^2}{8} + \frac{3\pi^2}{2} + \frac{3\pi^2}{4} + \frac{\pi^2}{8} \right\}\]

\[= \frac{7\pi^2}{2}\]
Practice Example

\[ f(x) \] is a continuous function for all real values of \( x \)
and satisfies \[ \int_0^x f(t) \, dt = \frac{t^2}{x} f(t) \, dt + \frac{x^6}{8} + \frac{x^3}{3} + k, \]
The value of \( k \) is

(a) \( \frac{167}{840} \) (b) \( -\frac{167}{840} \)
(c) \( \frac{17}{38} \) (d) none of these

Solution:

(b). We have,
\[ \int_0^x f(t) \, dt = \frac{t^2}{x} f(t) \, dt + \frac{x^6}{8} + \frac{x^3}{3} + k \quad \cdots (1) \]

For \( x = 1, \) \[ \int_0^1 f(t) \, dt = 0 + \frac{1}{8} + \frac{1}{3} + k = \frac{11}{24} + k \quad \cdots (2) \]

Differentiating both sides of (1), w.r.t. \( x, \) we get
\[ f(x) = -x^2 f(x) + 2x^{15} + 2x^2 \]
\[ \Rightarrow f(x) = \frac{2(x^{15} + x^3)}{1 + x^2} \]
\[ \therefore \int_0^x f(t) \, dt = 2 \int_0^1 \frac{(t^{15} + t^3)}{1 + t^2} = \frac{11}{24} + k \quad \text{(using (2))} \]

\[ \Rightarrow 2 \int_0^1 (t^{13} - t^{11} + t^9 - t^7 + t^5) \, dt = \frac{11}{24} + k \]
\[ \Rightarrow 2 \left( \frac{1}{14} - \frac{1}{12} + \frac{1}{10} - \frac{1}{8} + \frac{1}{6} \right) = \frac{11}{24} + k \]
\[ \Rightarrow k = -\frac{167}{840} \]
Practice Example

If \[ I = \int_{-\pi}^{\pi} \frac{e^{\sin x}}{e^{\sin x} + e^{-\sin x}} \, dx \] (1)
then \( I \) equals
(a) \( 2\pi \)  
(b) \( \pi \)  
(c) \( \pi/2 \)  
(d) \( \pi/4 \)

Ans. (b)

Solution \( \int_a^b f(x) \, dx = \int_a^b f(a + b - x) \, dx, \)
we get

\[ I = \int_{-\pi}^{\pi} \frac{e^{\sin(-x)}}{e^{\sin(-x)} + e^{-\sin(-x)}} \, dx \]

\[ \Rightarrow I = \int_{-\pi}^{\pi} \frac{e^{-\sin x}}{e^{-\sin x} + e^{\sin x}} \, dx \] (2)

Adding (1) and (2), we get

\[ 2I = \int_{-\pi}^{\pi} \frac{e^{\sin x} + e^{-\sin x}}{e^{\sin x} + e^{-\sin x}} \, dx = 2\pi. \]

\[ \Rightarrow I = \pi. \]
Practice Example

If \( I = \int_{0}^{a} \frac{a-x}{\sqrt{a+x}} \, dx, a > 0 \), then \( I \) equals

(a) \( \frac{1}{2} \left( a - \frac{\pi}{2} \right) \)

(b) \( \frac{a}{2} (\pi - 1) \)

(c) \( \frac{1}{\sqrt{2}} a (\pi - 1) \)

(d) \( a \left( \frac{\pi}{2} - 1 \right) \)

Ans. (d)

Solution

We can write

\[
I = \int_{0}^{a} \frac{a-x}{\sqrt{a^2-x^2}} \, dx
\]

\[
= \left[ a \sin^{-1} \left( \frac{x}{a} \right) + \sqrt{a^2-x^2} \right]_{0}^{a}
\]

\[
= a \left( \frac{\pi}{2} - 1 \right)
\]
Practice Example

If \( f(x) = \frac{x-1}{x+1} \), then \( f^k(f(x)) = f^k(x) \), \( k = 1 \)

\( 2, 3, \ldots \text{ and } \phi(x) = f^{1998}(x) \), then \( \int_{1/e}^{1} \phi(x) \, dx = \)

(a) 1  \hspace{1cm} (b) -1
(c) 0  \hspace{1cm} (d) none of these

Solution:

(b) We have, \( f(x) = \frac{x-1}{x+1} \)

\[
\Rightarrow f^2(x) = f(f(x)) = f \left( \frac{x-1}{x+1} \right) = \frac{\frac{x-1}{x+1}-1}{\frac{x-1}{x+1}+1} = -\frac{1}{x}
\]

\[
\Rightarrow f^4(x) = f^2(f^2(x)) = f^2 \left( -\frac{1}{x} \right) = \frac{-1}{-1} = x
\]

\[
\therefore \phi(x) = f^{1998}(x) = f^2(f^{1996}(x)) = f^2(x)
\]

\[
\Rightarrow f^{1996}(x) = \frac{f^4(f^4(f^4 \ldots f^4)(x))}{499 \text{ times}} = x
\]

\[
\Rightarrow \phi(x) = -\frac{1}{x}
\]

\[
\therefore \int_{1/e}^{1} \phi(x) \, dx = \int_{1/e}^{1} \left( -\frac{1}{x} \right) \, dx = \left( \log_e x \right) \bigg|_{1/e}^{1} = -1
\]

\[
= -(\log_e 1 - \log_e 1/e) = -(0 + 1) = -1
\]
Practice Example

If \( I = \int_0^\pi e^{(1/2)\cos t} \left( 2\sin \left( \frac{1}{2} \cos x \right) + 3\cos \left( \frac{1}{2} \cos x \right) \right) \sin x \, dx \),

then \( I \) equals

(a) \( 7\sqrt{e} \cos \left( \frac{1}{2} \right) \)
(b) \( 7\sqrt{e} \left[ \cos \left( \frac{1}{2} \right) - \sin \left( \frac{1}{2} \right) \right] \)
(c) 0
(d) none of these

Ans. (d)

Solution

Put \( \frac{1}{2} \cos x = t \), so that \( -\sin x \, dx = 2dt \) and

\[
I = \int_{\frac{-\pi}{2}}^{\frac{\pi}{2}} e^{it} \left( 2 \sin t + 3 \cos t \right) (-2) \, dt
\]

As \( e^{it} \sin t \) is an odd function, and \( e^{it} \cos t \) is an even function,

\[
I = 6 \int_0^{\pi/2} e^{it} \cos t \, dt - 6 \int_0^{\pi/2} e^{it} \sin t \, dt
\]

\[
\Rightarrow 7I = 6 \sqrt{e} \left( \cos \left( \frac{1}{2} \right) + \sin \left( \frac{1}{2} \right) \right) - 1
\]
Practice Example

\[
\lim_{n \to \infty} \frac{1}{n} \sum_{r=1}^{n} \sin^2 \frac{r \pi}{2n} \text{ is equal to}
\]

(a) \( \frac{2k!}{2^{2k} (k!)^2} \)

(b) \( \frac{2k!}{2^k (k!)} \)

(c) \( \frac{2k!}{2^k (k!)^2} \)

(d) none of these

Solution:

(a) \( \lim_{n \to \infty} \frac{1}{n} \sum_{r=1}^{n} \sin^2 \frac{r \pi}{2n} \)

\[
= \frac{1}{2} \frac{\pi x}{2} \left[ \frac{\pi^2}{2} \right]
\]

\[
= \frac{2}{\pi} \frac{(2k-1)(2k-3)\ldots1}{2k(2k-2)\ldots2}
\]

\[
= \frac{2^k [k(k-1)(k-2)\ldots1]}{2^k (2k-1)(2k-3)\ldots2 \cdot 1}
\]

\[
= \frac{(2k)!}{2^{2k} (k!)^2}.
\]
Practice Example

If \( I_1 = \int_0^{\pi/2} f(\sin 2x) \sin x \, dx \)

and \( I_2 = \int_0^{\pi/4} f(\cos 2x) \cos x \, dx \),

then \( \frac{I_1}{I_2} \) equals

(a) 1  
(b) \( \frac{1}{\sqrt{2}} \)  
(c) \( \sqrt{2} \)  
(d) 2

Ans. (c)

Solution  Using \( \int_0^a f(x) \, dx = \int_0^a f(a-x) \, dx \), we get

\[
I_1 = \int_0^{\pi/2} f(\sin (\pi - 2x)) \sin (\pi/2 - x) \, dx
= \int_0^{\pi/2} f(\sin 2x) \cos x \, dx
\]  \hspace{1cm} (2)

Adding (1) and (2) we get

\[
2I_1 = \int_0^{\pi/2} f(\sin 2x) (\sin x + \cos x) \, dx
= \sqrt{2} \int_0^{\pi/2} f(\sin 2x) \cos \left( x - \frac{\pi}{4} \right) \, dx
\]

Put \( x - \pi/4 = \theta \), so that

\[
2I_1 = \sqrt{2} \int_{-\pi/4}^{\pi/4} f(\sin (\pi/2 + 2\theta)) \cos \theta \, d\theta
= \sqrt{2} \int_{-\pi/4}^{\pi/4} f(\cos 2\theta) \cos \theta \, d\theta
= 2 \sqrt{2} I_2 \text{ as in integrand is an even function}
\]

\[ \Rightarrow I_1/I_2 = \sqrt{2}. \]
Practice Example

If \( I = \int_{-1}^{2} x \sin \pi x \, dx \), then \( I \) equals

(a) \( \frac{1}{\pi} \)  
(b) \( \frac{2}{\pi} \)  
(c) \( \frac{4}{\pi} \)  
(d) \( \frac{5}{\pi} \)

Ans. (d)

Solution  
We can write

\[
I = \int_{-1}^{1} x \sin \pi x \, dx + \int_{1}^{2} x \sin \pi x \, dx
\]

As \( x \sin \pi x \) is an even function, \( x \sin \pi x \geq 0 \), for \( 0 \leq x \pi \leq \pi \) and \( x \sin \pi x \leq 0 \) for \( \pi \leq x \pi \leq 2\pi \), we get

\[
I = 2 \int_{0}^{1} x \sin \pi x \, dx - \int_{1}^{2} x \sin \pi x \, dx
\]

But \( \int x \sin \pi x \, dx = \frac{-x \cos \pi x}{\pi} + \frac{1}{\pi} \int \cos \pi x \, dx \)

\[
= -\frac{x}{\pi} \cos \pi x + \frac{1}{\pi^2} \sin \pi x
\]

Thus,

\[
I = 2 \left( -\frac{1}{\pi} \cos \pi + 0 \right) - \left( -\frac{2}{\pi^2} \cos 2\pi + \frac{1}{\pi} \cos \pi \right)
\]

\[
= \frac{5}{\pi}
\]
Practice Example

If \( f(x) = \int_0^x (1 + t^3)^{-1/2} \, dt \) and \( g \) is the inverse of \( f \), then the value of \( \frac{g'}{g^2} \) is

(a) \( \frac{1}{2} \)  
(b) \( \frac{3}{2} \)  
(c) 1  
(d) cannot be determined

Solution:

(b). We have,

\[
f(x) = \int_0^x (1 + t^3)^{-1/2} \, dt
\]

\[
\Rightarrow f(g(x)) = \int_0^{g(x)} (1 + t^3)^{-1/2} \, dt
\]

\[
\Rightarrow x = \int_0^{g(x)} (1 + t^3)^{-1/2} \, dt
\]

[g is inverse of \( f \Rightarrow f(g(x)) = x \)]

Differentiating w.r.t. \( x \), we have

\[
1 = (1 + g^3)^{-1/2} \cdot g'
\]

i.e.,

\[
(g')^2 = 1 + g^3
\]

Differentiating again w.r.t. \( x \), we have

\[
2g'g'' = 3g^2g'
\]

\[
\Rightarrow \frac{g''}{g^2} = \frac{3}{2}.
\]
Practice Example

Let \( f(x) = \frac{|x|}{x} \) if \( x \neq 0 \) and \( f(0) = 0 \) and \( a, b \) \( \in \mathbb{R} \) be such that \( a < b \). Then value of

\[
I = \int_a^b f(x) \, dx
\]

(a) \( |b| - |a| \)
(b) \( \frac{1}{2} (b^2 - a^2) \)
(c) Max \{ |a|, |b| \}
(d) Min \{ |a|, |b| \}

Ans. (a)

Solution

Note that

\[
f(x) = \begin{cases} 
-1 & \text{if } x < 0 \\
0 & \text{if } x = 0 \\
1 & \text{if } x > 0
\end{cases}
\]

If \( 0 \leq a < b \), then

\[
I = \int_a^b dx = b - a = |b| - |a|
\]

If \( a < 0 \leq b \), then

\[
I = \int_a^b (-1) \, dx + \int_0^b 1 \, dx = a + b = b - (-a)
\]

= \( |b| - |a| \)

If \( a < b < 0 \), then

\[
I = \int_a^b (-1)dx = - b + a = |b| - |a|.
\]
Practice Example

If $I_n = \int_0^{\pi/2} \cos^n x \cos nx \, dx$, then $I_1, I_2, I_3$ are in

(a) A.P.  
(b) G.P.  
(c) H.P.  
(d) none of these

Solution:

(b). $I_n = \int_0^{\pi/2} \cos^n x \cos nx \, dx$

$$= \left[ \cos^n x \cdot \frac{\sin nx}{n} \right]_0^{\pi/2} - \int_0^{\pi/2} n \cos^{n-1} x (-\sin x) \cdot \frac{\sin nx}{n} \, dx$$

$$= \frac{\pi}{2} \cos^{n-1} x \sin x \sin nx \, dx$$

$$= \int_0^{\pi/2} \cos^{n-1} x \cos (n-1)x - \int_0^{\pi/2} \cos^n x \cos nx \, dx$$

[Using the identity $\cos(n-1)x = \cos n x \cos x + \sin n x \sin x$

i.e., $\sin n x \sin x = \cos (n-1)x - \cos n x \cos x$]

$$= \int_0^{\pi/2} \cos^{n-1} x \cos (n-1)x - \int_0^{\pi/2} \cos^n x \cos nx \, dx$$

$$= I_{n-1} - I_n$$

$$i.e., \frac{I_n}{I_{n-1}} = \frac{1}{2} \Rightarrow I_1, I_2, I_3 \text{ are in G.P}$$
Practice Example

\[
\int_{0}^{k\pi} \sin \left(\frac{2x}{\pi}\right) \, dx = A \cdot \frac{\sin k \sin \left(\frac{k+1}{2}\right)}{\sin \frac{1}{2}}, \text{ where } A \text{ is equal to }
\]

(a) \pi
(b) \frac{\pi}{4}
(c) \frac{\pi}{2}
(d) none of these

Solution:

\[
\int_{0}^{k\pi} \sin \left(\frac{2x}{\pi}\right) \, dx
= \int_{0}^{\pi/2} \sin 0 \, dx + \int_{\pi/2}^{2\pi/2} \sin 1 \, dx + \int_{2\pi/2}^{3\pi/2} \sin 2 \, dx + \ldots
+ \int_{(2k-1)\pi/2}^{2k\pi/2} \sin(2k-1) \, dx
\]

\[
= \frac{\pi}{2} \left[ \sin 1 + \sin 2 + \sin 3 + \ldots + \sin (2k-1) \right]
\]

\[
= \frac{\pi}{2} \left[ \frac{\sin \frac{1}{2} \sin \frac{1}{2}}{\sin \frac{1}{2}} + \sin \frac{1}{2} \sin \frac{3}{2} + \ldots + \sin \frac{1}{2} \sin (2k-1) \right]
\]

\[
= \frac{\pi}{2} \sin \frac{1}{2} \sin (2k-1)
\]
\[ \begin{align*}
\pi & \left[ \cos \frac{1}{2} - \cos \frac{3}{2} + \cos \frac{3}{2} - \cos \frac{5}{2} + \ldots \right] \\
& = \frac{\pi}{2} \left[ \cos \left(2k - \frac{3}{2}\right) - \cos \left(2k + \frac{1}{2}\right)\right] \\
& = \frac{\pi}{2} \left( \frac{1}{2} - \cos \frac{1}{2} \right) \\
& = \frac{\pi}{2} \frac{\sin \left( \frac{k + \frac{1}{2}}{2} \right)}{\sin \left( \frac{1}{2} \right)} \\
\therefore A &= \pi 2.
\end{align*} \]
Practice Example

For $x > 0$, let $f(x) = \int_{1}^{x} \frac{\ln t}{1 + t} \, dt$. Then, the value of $f(e) + f\left(\frac{1}{e}\right)$ is

(a) 1  
(b) 2  
(c) $\frac{1}{2}$  
(d) none of these.

Solution:

(c). We have,

\[
f(x) = \int_{1}^{x} \frac{\ln t}{1 + t} \, dt, \quad x > 0 \quad \ldots (1)
\]

\[
\Rightarrow f\left(\frac{1}{x}\right) = \int_{1}^{1/x} \frac{\ln t}{1 + t} \, dt
\]

Put $y = \frac{1}{t} \Rightarrow dt = -\frac{1}{y^2} \, dy$

\[
\Rightarrow f\left(\frac{1}{x}\right) = \int_{1}^{x} \frac{\ln \left(\frac{1}{y}\right)}{1 + \frac{1}{y}} \left(-\frac{1}{y^2}\right) \, dy
\]

\[
= \int_{1}^{x} \frac{\ln y}{y(1 + y)} \, dy
\]

\[
= \int_{1}^{x} \frac{\ln t}{(1 + t)t} \, dt \quad \ldots (2)
\]

From (1) and (2),

\[
f(x) + f\left(\frac{1}{x}\right) = \int_{1}^{x} \frac{(1 + \frac{1}{t}) \ln t}{1 + t} \, dt
\]

\[
= \int_{1}^{x} \frac{\ln t}{t} \, dt = \frac{(\ln x)^2}{2}
\]

\[
\Rightarrow f(e) + f\left(\frac{1}{e}\right) = \frac{(\ln e)^2}{2} = \frac{1}{2}
\]
Practice Example

If \( I_n = \int_0^1 (1 - x^a)^n \, dx \), then \( \frac{I_n}{I_{n+1}} = 1 + \frac{1}{k} \), where \( k = \)
(a) \((n + 1)a\)  
(b) \(na\)  
(c) \((n - 1)a\)  
(d) none of these

Solution:

(a). We have,

\[
I_{n+1} = \int_0^1 (1 - x^a)^{n+1} \, dx
= \left[ x(1 - x^a)^{n+1} \right]_0^1 + (n+1)a \int_0^1 x^a (1 - x^a)^n \, dx
= (n+1)a \int_0^1 (x^a - 1 + 1)(1 - x^a)^n \, dx
= (n+1)a \int_0^1 (1 - x^a)^n \, dx \cdot (n+1)a \int_0^1 (1 - x^a)^{n+1} \, dx
= (n+1)a I_n - (n+1) a I_{n+1}
\]

\[
\Rightarrow \frac{I_n}{I_{n+1}} = 1 + \frac{1}{(n+1)a} \quad \therefore k = (n+1)a
\]
Practice Example

If \( I = \int_a^b \left[ \log \log x + \frac{1}{\log x} \right] dx \), then \( I \)
equals

(a) \( \alpha \log \log \alpha - \beta \log \log \beta \)
(b) \( \frac{1}{\alpha} - \frac{1}{\beta} + \log \log \alpha - \log \log \beta \)
(c) \( \frac{\beta - \alpha}{\alpha \beta} + \alpha \log \log \alpha - \beta \log \log \beta \)
(d) none of these

Ans. (d)

Solution

Put \( \log x = t \), or \( x = e^t \), so that

\[ I = \int_a^b \left[ \log t + \frac{1}{t^2} \right] e^t \, dt \]

where \( a = \log \alpha, b = \log \beta \)

\[
= \int_a^b \left( \log t + \frac{1}{t} + \left( \frac{1}{t} \right) + \left( \frac{1}{t^2} \right) \right) e^t \, dt \\
= \left( \log t - \frac{1}{t} \right) e^t \bigg|_a^b \\
[\text{ use } \int e^x \left( f(x) + f'(x) \right) = e^x f(x)]
= \left( \log b - \frac{1}{b} \right) e^b - \left( \log a - \frac{1}{a} \right) e^a \\
= \left( \log b - \frac{1}{\log \beta} \right) \beta - \left( \log \log \alpha - \frac{1}{\log \alpha} \right) \alpha
\]

Practice Example

Let \( \phi(x) = \int_0^x g(t) \, dt \), where the function \( g \) is such that

\[
\begin{align*}
\frac{1}{2} & \leq g(t) \leq 0, \quad \forall \ t \in [0, 1] \\
\frac{1}{2} & \leq g(t) \leq 1, \quad \forall \ t \in [1, 3] \\
g(t) & \leq 1, \quad \forall \ t \in [3, 4]
\end{align*}
\]

Then, \( \phi(4) \) satisfies the inequality

(a) \( \frac{1}{2} \leq \phi(4) \leq 3 \)  \quad (b) \( 0 \leq \phi(4) \leq 2 \)
(c) \( \phi(4) \leq 3 \)  \quad (d) \ none \ of \ these
Solution:

\[ \phi(4) = \int_0^4 g(t) \, dt = \int_0^1 g(t) \, dt + \int_1^3 g(t) \, dt + \int_3^4 g(t) \, dt \]

But

\[ -\frac{1}{2} \cdot 1 \leq \int_0^1 g(t) \, dt \leq 0.1 \]

\[ \frac{1}{2} \cdot 2 \leq \int_1^3 g(t) \, dt \leq 0.2 \]

\[ \frac{4}{3} \geq \int_3^4 g(t) \, dt \leq 1.1 \]

Adding the above inequalities, we get \( \phi(4) \leq 3 \)

Practice Example

If \( I = \int_0^{\sqrt{2}} \frac{\sqrt{x} \, dx}{(1+x)(2+x)(3+x)} \), then \( I \)

equals

(a) \( \frac{\pi}{2} (2\sqrt{2} - \sqrt{3} - 1) \)

(b) \( \frac{\pi}{2} (2\sqrt{2} + \sqrt{3} - 1) \)

(c) \( \frac{\pi}{2} (2\sqrt{2} - \sqrt{3} + 1) \)

(d) none of these

Ans. (a)

Solution

Put \( \sqrt{x} = t \) or \( x = t^2 \), so that

\[ I = 2 \int_0^1 \frac{t^2}{(1+t^2)(2+t^2)(3+t^2)} \, dt \]

\[ = \int_0^1 \left( \frac{1}{1+t^2} + \frac{4}{2+t^2} - \frac{3}{3+t^2} \right) \, dt \]

\[ = -\tan^{-1} 1 + \tan^{-1} \left( \frac{t}{\sqrt{2}} \right) - \frac{3}{\sqrt{3}} \tan^{-1} \left( \frac{t}{\sqrt{3}} \right) \bigg|_0^1 \]

\[ = \left( -\tan^{-1} 1 + \tan^{-1} \left( \frac{\pi}{2} \right) - \frac{3}{\sqrt{3}} \tan^{-1} \left( \frac{\pi}{2} \right) \right) \]

\[ = -\frac{\pi}{2} + 2\sqrt{2} \left( \frac{\pi}{2} \right) - \sqrt{3} \left( \frac{\pi}{2} \right) \]

\[ = \frac{\pi}{2} (2\sqrt{2} - \sqrt{3} - 1) . \]
Practice Example

\[
\int_1^4 (\{x\}^{[x]}) \, dx, \text{ where } \{\cdot\} \text{ and } [\cdot] \text{ denote the fractional part and greatest integer function, respectively, is equal to}
\]
(a) 1 \quad (b) \frac{12}{13} \quad (c) \frac{13}{12} \quad (d) \frac{6}{7}

Solution:

(c). We have,
\[
\int_1^4 (\{x\}^{[x]}) \, dx
\]
\[
= \int_1^2 (x-[x])^{[x]} \, dx
\]
\[
= \int_1^2 (x-[x])^{[x]} \, dx + \int_2^3 (x-[x])^{[x]} \, dx
\]
\[
+ \int_3^4 (x-[x])^{[x]} \, dx
\]
\[
= \int_1^2 (x-1)^{[x]} \, dx + \int_2^3 (x-2)^{[x]} \, dx + \int_3^4 (x-3)^{[x]} \, dx
\]
\[
= \left[ \frac{(x-1)^2}{2} \right]_1^2 + \left[ \frac{(x-2)^3}{3} \right]_2^3 + \left[ \frac{(x-3)^4}{4} \right]_3^4
\]
\[
= \left( \frac{1}{2} - 0 \right) + \left( \frac{1}{3} - 0 \right) + \left( \frac{1}{4} - 0 \right) = \frac{13}{12}
\]
Practice Example

The value $\int_0^1 \cot^{-1}(1 + x^2 - x) \, dx$ is

(a) $\pi/2 - \log 2$  
(b) $\pi - \log 2$

(c) $\pi/4 - \log 2$  
(d) $2 \int_0^1 \tan^{-1} x \, dx$

Ans. (a), (d)

Solution

$\cot^{-1}(1 + x^2 - x) = \tan^{-1}\left(\frac{x + 1 - x}{1 - x(x - 1)}\right)$

\[ = \tan^{-1} x + \tan^{-1}(1 - x) \]

\[ I = \int_0^1 \cot^{-1}(1 + x^2 - x) \, dx = \int_0^1 \tan^{-1} x \, dx + \int_0^1 \tan^{-1}(1 - x) \, dx \]

\[ = \left[ x \tan^{-1} x \right]_0^1 - \int_0^1 \frac{2x}{1 + x^2} \, dx \]

\[ = 2 \tan^{-1}(1) - \log(1 + x^2) \right|_0^1 \]

\[ = 2(\pi/4) - \log 2 = \pi/2 - \log 2 \]
Practice Example

If \([ \cdot ]\) denotes the greatest integer function, then

\[
\int_{0}^{2} [x + [x + [x]]] \, dx =
\]

(a) 1 \hspace{1cm} (b) 2

(c) 3 \hspace{1cm} (d) 0

Solution :

\[
I = \int_{0}^{2} [x + [x + [x]]] \, dx
\]

\[
= \int_{0}^{2} [x + 2[x]] \, dx \quad (\because [x + \text{Integer}] = [x] + \text{Integer} \Rightarrow [x + [x]] = [x] + [x])
\]

\[
= \int_{0}^{2} [x] + 2[x] \, dx = \int_{0}^{2} 3[x] \, dx
\]

\[
= 3 \left\{ \int_{0}^{1} [x] \, dx + \int_{1}^{2} [x] \, dx \right\}
\]

\[
= 3 \left\{ \int_{0}^{1} 0 \, dx + \int_{1}^{2} 1 \, dx \right\}
\]

\[
= 3 \left\{ (x)_{1}^{2} \right\} = 3 (2 - 1) = 3.
\]
Practice Example

The value of \[ \int_0^{\pi/2} \frac{x \sin x \cos x}{\sin^4 x + \cos^4 x} \, dx \] is

(a) \( \left( \frac{5 \pi^4}{4} \right) \frac{\sin 2x}{\cos^4 x + \sin^4 x} \, dx \)
(b) \( \frac{\pi^2}{16} \)
(c) \( 3 \frac{\pi^2}{4} \)
(d) \( \frac{\pi^2}{2} \)

Solution

\[ I = \int_0^{\pi/2} \frac{x \sin x \cos x}{\sin^4 x + \cos^4 x} \, dx = \int_0^{\pi/2} \frac{(\pi/2 - x) \sin x \cos x}{\sin^4 x + \cos^4 x} \, dx \]

\[ = \frac{\pi}{2} \int_0^{\pi/2} \frac{\sin x \cos x}{\sin^4 x + \cos^4 x} \, dx - \int_0^{\pi/2} \frac{x \sin x \cos x}{\sin^4 x + \cos^4 x} \, dx \]

\[ \Rightarrow 2I = \frac{\pi}{2} \int_0^{\pi/2} \frac{\sin x \cos x}{\sin^4 x + \cos^4 x} \, dx \]

\[ \Rightarrow I = \frac{\pi}{4} \int_0^{\pi/2} \frac{1}{2} \frac{\sin 2x}{1 - \frac{1}{2} \sin^2 2x} \, dx = \frac{\pi}{4} \int_0^{\pi/2} \frac{\sin 2x}{1 + \cos^2 2x} \, dx \]

\[ = - \frac{\pi}{8} \int_1^{-1} \frac{dt}{1 + t^2} = - \frac{\pi}{8} [\tan^{-1} (-1) - \tan^{-1} 1] = \frac{\pi^2}{16} \]

The integrand in (a) is a periodic function with period \( \pi \), since

\[ f(x + \pi) = \frac{\sin 2(x + \pi)}{\cos^4 (x + \pi) + \sin^4 (x + \pi)} = \frac{\sin 2x}{\cos^4 x + \sin^4 x} = f(x) \]

\[ \therefore \int_\pi^{5\pi/4} \frac{2 \sin 2x}{\cos^4 x + \sin^4 x} \, dx = \int_0^{\pi/4} \frac{\sin 2x}{\cos^4 x + \sin^4 x} \, dx \]

\[ = \left. 2 \int_0^{\pi/4} \tan x \sec^2 x \, dx \right|_0^1 = \frac{\pi}{4} \]
**Practice Example**

\[
\frac{\pi}{2} \quad \frac{\pi}{4} \quad \frac{\pi}{6} \quad \frac{\pi}{12}
\]

Solution:

(d) Let 
\[
I = \int \frac{x}{\sqrt{\frac{(a^2+b^2)/2}{(x^2-a^2)(b^2-x^2)}}} \, dx
\]

Put \(x^2 = a^2 \cos^2 t + b^2 \sin^2 t\)
\[2 \, x \, dx = (2a^2 \cos t (- \sin t) + 2b^2 \sin t (\cos t)) \, dt\]
\[x \, dx = \frac{1}{2} (b^2-a^2) \sin 2t \, dt\]

For \(x^2 = \frac{a^2+b^2}{2} = a^2 \cos^2 t + b^2 \sin^2 t\)
\[a^2 + b^2 = 2(1-\sin^2 t) a^2 + 2b^2 \sin^2 t\]

or, \((a^2+b^2) = 2a^2 + 2(b^2-a^2) \sin^2 t\)
\[\sin^2 t = \frac{1}{2} \Rightarrow \cos 2t = 0 \Rightarrow t = \pi/4\]

For \(x^2 = \frac{3a^2+b^2}{4} = a^2 \cos^2 t + b^2 \sin^2 t\)
\[3a^2 + b^2 = 4a^2 + 4(b^2-a^2) \sin^2 t\]
\[\sin^2 t = \frac{1}{4} \Rightarrow \cos 2t = \frac{1}{2} \Rightarrow t = \pi/4\]

\[I = \int_{\pi/6}^{\pi/4} \frac{(b^2-a^2) \sin 2t \, dt}{2 \sqrt{(b^2-a^2) \sin^2 t (b^2-a) \cos^2 t}}\]
\[= \int_{\pi/6}^{\pi/4} dt = (t) \bigg|_{\pi/12}^{\pi/4} = \frac{\pi}{4} - \frac{\pi}{6} = \frac{\pi}{12}\]
Practice Example

If \( \int_0^{\pi/2} \frac{x^2 \cos x}{(1 + \sin x)^2} \, dx = A \pi - \pi^2 \) then \( A \) is

**Ans. 2**

**Solution** Integrating by parts, we have

\[
\int_0^{\pi/2} \frac{x^2 \cos x}{(1 + \sin x)^2} \, dx = - \left( \frac{x^2}{1 + \sin x} \right)_0^\pi + 2 \int_0^{\pi/2} \frac{x}{1 + \sin x} \, dx = - \pi^2 + 2I
\]

where

\[
I = \int_0^{\pi/2} \frac{x}{1 + \sin x} \, dx = \int_0^{\pi/2} \frac{\pi - x}{1 + \sin x} \, dx = \pi \int_0^{\pi/2} \frac{dx}{1 + \sin x} - I
\]

\[\Rightarrow 2I = \pi \int_0^{\pi/2} \frac{dx}{1 + \sin x} = 2\pi \int_0^{\pi/2} \frac{dx}{1 + \sin x}
\]

\[\Rightarrow I = \pi \int_0^{\pi/2} \frac{dx}{1 + \sin x} = \pi \int_0^{\pi/2} \frac{dx}{1 + \sin (\pi/2 - x)}
\]

\[= \int_0^{\pi/2} \frac{dx}{1 + \cos x}
\]

\[= \frac{\pi}{2} \int_0^{\pi/2} \sec^2 (x/2) \, dx = \pi \tan \left( \frac{x}{2} \right)_0^{\pi/2} = \pi
\]

Hence \( \int_0^{\pi/2} \frac{x^2 \cos x}{(1 + \sin x)^2} \, dx = - \pi^2 + 2 \pi \)
Practice Example (CBSE 2010)

Evaluate: \[ \int_{\pi/6}^{\pi/3} \frac{\sin x + \cos x}{\sqrt{\sin 2x}} \, dx \]  

[CBSE 2010, 4 marks]

Soln.:

Let \( \sin x - \cos x = t \) \ldots \,(i)

Differentiating, \( \cos x + (\sin x) \, dx = dt \)

Or, \( (\cos x + \sin x) \, dx = \frac{dt}{\sqrt{2}} \)

Also,

Squaring (i),

\[ \sin^2 x + \cos^2 x = 2 \sin x \cos x = t^2 \]

Or, \( 1 - 2 \sin x \cos x = t^2 \)

Or, \( 1 - \sin 2x = t^2 \)

Or, \( \sin 2x = 1 - t^2 \)

Therefore, \( I = \int_{\pi/6}^{\pi/3} \frac{\sin x + \cos x}{\sqrt{\sin 2x}} \, dx \)

\[ = \int_{1/2}^{\sqrt{3}/2} \frac{dt}{\sqrt{1-t^2}} \]

\[ = \left[ \sin^{-1} \left( \frac{t}{\sqrt{2}} \right) \right]^{\sqrt{3}-1}_{1-\sqrt{3}} \]

\[ = \sin^{-1} \left( \frac{\sqrt{3}-1}{2} \right) - \sin^{-1} \left( \frac{1-\sqrt{3}}{2} \right) \]

\[ = \sin^{-1} \left( \frac{\sqrt{3}-1}{2} \right) + \sin^{-1} \left( \frac{\sqrt{3}-1}{2} \right) \]

\[ = 2 \sin^{-1} \left( \frac{\sqrt{3}-1}{2} \right) \]  

Ans.
Practice example

Integration Sin \( n \) plus half by Sin x by 2

\[
\text{The value of the integral } \int_0^\pi \frac{\sin (n + \frac{1}{2}) x}{\sin (x/2)} \, dx \quad (0, \pi) \in N
\]

(a) \( \pi \) 
(b) \( 2\pi \) 
(c) \( 3\pi \) 
(d) none of these

**Ans. (a)**

**Solution** We have, 
\[
2 \sin \frac{x}{2} \left( \frac{1}{2} + \cos x + \cos 2x + \ldots + \cos nx \right)
\]

\[
= \sin \frac{x}{2} \cdot + 2 \sin \frac{x}{2} \cos x + 2 \sin \frac{x}{2} \cos 2x + \ldots + 2 \sin \frac{x}{2} \cos nx
\]

\[
= \sin \frac{x}{2} + \sin \frac{3x}{2} - \sin \frac{x}{2} + \sin \frac{5x}{2} - \sin \frac{3x}{2} + \ldots
\]

\[
+ \sin \left( \frac{n + 1}{2} \right) x - \sin \left( \frac{n - 1}{2} \right) x = \sin \left( \frac{n + 1}{2} \right) x
\]

\[
\Rightarrow \int_0^\pi \frac{\sin (n + \frac{1}{2}) x}{\sin (x/2)} \, dx = 2 \left( \int_0^\pi \frac{1}{2} \, dx + \int_0^\pi \cos x \, dx + \ldots \right) + \int_0^\pi \cos nx \, dx
\]

\[
= 2 \left( \frac{\pi}{2} + \sin \frac{\pi}{2} \right) + \ldots + \sin \frac{nx}{n} \bigg|_0^\pi = \pi
\]

Practice example

**Example** 

\[
\int_0^\pi \frac{dx}{(1 + a^2) - 2a \cos x} = \frac{\pi}{\frac{1}{1-a^2}} \quad \text{or} \quad \frac{\pi}{a^2 - 1}
\]

The given problem may be re-written in the form

\[
\int_0^\pi \frac{dx}{(1 + a^2) - 2a \left( \frac{\cos^2 \frac{x}{2} + \sin^2 \frac{x}{2}}{2} \right)} - 2a \left( \frac{\cos^2 \frac{x}{2} - \sin^2 \frac{x}{2}}{2} \right)
\]

which can be expressed in the forms

\[
I = \frac{2}{(1 + a^2)} \int \frac{dt}{(1-a^2) + t^2} \quad \text{or} \quad \frac{2}{(1 + a^2)} \int \frac{dt}{(a-1)^2 + t^2}
\]

according as \( a < 1 \) or \( a > 1 \), where \( t = \tan \frac{x}{2} \)

Hence
Hence
\[ I = \frac{2}{(1 - a^2)} \left[ \tan^{-1} \frac{t(1 + a)}{1 - a} \right]_0^\infty = \frac{\pi}{1 - a^2} \] if \( a < 1 \)

Similarly in the other case the answer shall be \( \frac{\pi}{a^2 - 1} \), \( a > 1 \)

Practice example

\[ \int_0^\infty \sin^{-1}(\sqrt{t}) \, dt + \int_0^\infty \cos^{-1}(\sqrt{t}) \, dt \] is equal to

(a) \( \frac{\pi}{4} \)  (b) \( \frac{\pi}{6} \)  (c) 0  (d) none of these

Solution:

(a). We have,
\[
I = \int_0^{\sin^2 x} \sin^{-1}(\sqrt{t}) \, dt + \int_0^{\cos^2 x} \cos^{-1}(\sqrt{t}) \, dt
\]
\[
= [t \sin^{-1}(\sqrt{t})]_0^{\sin^2 x} - \int_0^{\sin^2 x} \frac{\sqrt{t}}{\sqrt{1-t}} \, dt
\]
\[
+ [t \cos^{-1}(\sqrt{t})]_0^{\cos^2 x} - \int_0^{\cos^2 x} \frac{\sqrt{t}}{\sqrt{1-t}} \, dt
\]
\[
= x \sin^2 x + \int_0^{\sin^2 x} \frac{\sqrt{t}}{\sqrt{1-t}} \, dt + x \cos^2 x + \int_0^{\cos^2 x} \frac{\sqrt{t}}{\sqrt{1-t}} \, dt
\]
Putting $t = \sin^2 \theta$ and $dt = 2 \sin \theta \cos \theta \, d\theta$, we get,

$$
\int \frac{\sqrt{t}}{1-t} \, dt = \int \frac{\sin \theta}{\sqrt{1-\sin^2 \theta}} \times 2 \sin \theta \cos \theta \, d\theta
$$

$$
= \int \sin^2 \theta \, d\theta = \int \frac{1-\cos 2\theta}{2} \, d\theta
$$

$$
= \frac{\theta}{2} - \frac{\sin 2\theta}{4}
$$

Also, when $t = \sin^2 x$, $\theta = x$ and when $t = \cos^2 x$, $\theta = \pi/2 - x$

$$
\therefore \quad I = x + \left[ \frac{\theta}{2} - \frac{\sin 2\theta}{4} \right]_x
$$

$$
= x + \left( \frac{\pi}{4} - \frac{x}{2} \right) - \left( \frac{x}{2} - \frac{\sin 2x}{4} \right)
$$

$$
= x + \frac{\pi}{4} - x = \frac{\pi}{4}
$$

Practice example

$$
I = \int_{\pi/4}^{\pi/4} \frac{\sin 2\theta \, d\theta}{\sin^4 \theta + \cos^4 \theta} = \int_{\pi/4}^{\pi/4} \frac{2 \sin \theta \cos \theta \, d\theta}{\sin^4 \theta + \cos^4 \theta}
$$

$$
= \int_{\pi/4}^{\pi/4} \frac{2 \tan \theta \sec^2 \theta \, d\theta}{1 + \tan^4 \theta}
$$

Dividing the numerator and denominator by $\cos^4 \theta$

Put $\tan^2 \theta = t$,

so that $2 \tan \theta \sec^2 \theta \, d\theta = dt$.

When $\theta = 0$,

$t = \tan^2 0 = 0$
and when $\theta = \frac{\pi}{4}$,
\[ t = \tan^2 \frac{1}{4} \pi = 1. \]
\[ \therefore \quad I = \int_{0}^{1} \frac{dt}{1 + t^2} = \left[ \tan^{-1} t \right]_{0}^{1} \]
\[ = \tan^{-1} 1 - \tan^{-1} 0 = \frac{\pi}{4} - 0 = \frac{\pi}{4} \]

Practice example

If $f(x)$ satisfies the relation
\[ \int_{-2}^{x} f(t) \, dt + xf''(3) \]
\[ = \int_{1}^{2} x^3 \, dx + f'(1) \int_{1}^{2} x^2 \, dx + f''(2) \int_{1}^{2} x \, dx, \text{ then} \]

(a) $f(x) = x^3 + 5x^2 + 2x - 6$
(b) $f(x) = x^3 - 5x^2 + 2x + 6$
(c) $f(x) = x^3 + 5x^2 + 2x - 6$
(d) $f(x) = x^3 - 5x^2 + 2x - 6$

Solution:

(d). Differentiating the given equation w.r.t. $x$, we get
\[ f(x) + f''(3) = x^3 + x^2 f'(1) + xf''(2) \quad \ldots(1) \]

Differentiating successively w.r.t. $x$, we get
\[ f'(x) = 3x^2 + 2xf'(1) + f''(2) \quad \ldots(2) \]
\[ f''(x) = 6x + 2f'(1) \quad \ldots(3) \]
\[ f'''(x) = 6 \quad \ldots(4) \]

Putting $x = 1, 2$ and $3$ in equations (2), (3) and (4) respectively, we get
\[ f'(1) = 3 + 2f'(1) + f''(2), \quad f''(2) = 12 + 2f'(1) \]
and
\[ f'''(3) = 6 \]

Solving, we have
\[ f'(1) = -5, f''(2) = 2, f'''(3) = 6 \]

Putting the values in equation (1), we have
\[ f(x) = x^3 - 5x^2 + 2x - 6. \]
Practice example

If \( I_1 = \int_{1/e}^{e} \frac{t}{1 + t^2} \, dt \) and \( I_2 = \int_{1/e}^{e} \frac{\cot t}{t^2} \, dt \) then the value of \( I_1 + I_2 \) is

(a) \( 1/2 \)
(b) \( 1 \)
(c) \( e/2 \)
(d) \( (1/2)(e + 1/e) \)

Ans. (b)

Solution Putting \( t = 1/u \) in \( I_2 \) we have

\[
I_2 = -\int_{e}^{1} \frac{u \, du}{1 + u^2} = -\int_{1/e}^{e} \frac{u \, du}{1 + u^2} + \int_{1/e}^{e} \frac{u \, du}{1 + u^2}
\]

\[
= -I_1 + \frac{1}{2} \int_{1/e}^{e} \frac{2u \, du}{1 + u^2}
\]

So

\[
I_1 + I_2 = \left. \frac{1}{2} \log(u^2 + 1) \right|_{1/e}^{e} = \frac{1}{2} \left[ \log(e^2 + 1) - \log\left(\frac{e^2}{e^2} + 1\right) \right]
\]

\[
= \frac{1}{2} \times 2 = 1.
\]
Practice example

\[
\lim_{x \to 0} \frac{\int_{0}^{y} e^{\sin^2 t} \, dt - \int_{0}^{y} e^{\sin^2 t} \, dt}{x} = \int_{0}^{x+y} e^{\sin^2 t} \, dt - \int_{0}^{y} e^{\sin^2 t} \, dt
\]
where \( y \) is a constant independent of \( x \), is equal to

(a) \( e^{\sin^2 y} \)  
(b) \( 2e^{\sin^2 y} \)  
(c) \( -e^{\sin^2 y} \)  
(d) none of these

Solution:

\[
\lim_{x \to 0} \frac{\int_{0}^{x+y} e^{\sin^2 t} \, dt - \int_{0}^{y} e^{\sin^2 t} \, dt}{x} = \lim_{x \to 0} \frac{\int_{0}^{x+y} e^{\sin^2 t} \, dt}{x}
\]

\[
= \lim_{x \to 0} \frac{e^{\sin^2(x+y)}(x+y) - e^{\sin^2 y} \cdot dy}{dx}
\]

\[
= \lim_{x \to 0} \frac{e^{\sin^2(x+y)} \cdot 1 - e^{\sin^2 y} \cdot 0}{1} = e^{\sin^2 y}
\]
Practice example

Evaluate \( \int_0^a (a^2 + x^2)^{\frac{3}{2}} \, dx \).

Solution :

\[ I = \int_0^a (a^2 + x^2)^{\frac{3}{2}} \, dx \]

Put \( x = a \tan \theta \)

\[ \therefore \ dx = a \sec^2 \theta \, d\theta \]

\[ = \int_0^{\frac{\pi}{4}} (a^2 + a^2 \tan^2 \theta)^{\frac{3}{2}} \cdot a \sec^2 \theta \, d\theta \]

\[ = a^6 \int_0^{\frac{\pi}{4}} \sec^3 \theta \, d\theta \]

\[ = a^6 \left[ \frac{1}{6} \left( \sec \theta \tan \theta \right)_{0}^{\frac{\pi}{4}} + \frac{5}{6} \int_0^{\frac{\pi}{4}} \sec^3 \theta \, d\theta \right] \]

\[ = a^6 \left[ \frac{2\sqrt{2}}{3} + \frac{5}{6} \int_0^{\frac{\pi}{4}} \sec^3 \theta \, d\theta \right] \]

\[ = a^6 \left[ \frac{2\sqrt{2}}{3} + \frac{5}{6} \left( \frac{\sec^3 \theta + \tan \theta}{4} \right)_{0}^{\frac{\pi}{4}} + \frac{3}{4} \int_0^{\frac{\pi}{4}} \sec^3 \theta \, d\theta \right] \]

\[ = a^6 \left[ \frac{2\sqrt{2}}{3} + \frac{5}{6} \left( \frac{2\sqrt{2}}{4} + \frac{3}{4} \int_0^{\frac{\pi}{4}} \sec^3 \theta \, d\theta \right) \right] \]

\[ = a^6 \left[ \frac{2\sqrt{2}}{3} + \frac{5\sqrt{2}}{12} + \frac{5}{8} \int_0^{\frac{\pi}{4}} \sec^3 \theta \, d\theta \right] \]

\[ = a^6 \left[ \frac{2\sqrt{2}}{3} + \frac{5\sqrt{2}}{12} + \frac{5}{8} \left( \sec \theta \tan \theta \right)_{0}^{\frac{\pi}{4}} + \frac{1}{2} \int_0^{\frac{\pi}{4}} \sec \theta \, d\theta \right] \]

\[ = a^6 \left[ \frac{2\sqrt{2}}{3} + \frac{5\sqrt{2}}{12} + \frac{5}{8} \left( \frac{\sqrt{2}}{2} + \frac{1}{2} \log \left( \sec \theta + \tan \theta \right) \right)_{0}^{\frac{\pi}{4}} \right] \]

\[ = a^6 \left[ \frac{2\sqrt{2}}{3} + \frac{5\sqrt{2}}{12} + \frac{5\sqrt{2}}{16} + \frac{5}{16} \log \left( \sqrt{2} + 1 \right) \right] \]
\[ = \frac{a^b}{48} \left[ \frac{32\sqrt{2}}{48} + \frac{20\sqrt{2}}{48} + \frac{15\sqrt{2}}{48} + \frac{5}{16} \log \left( \sqrt{2} + 1 \right) \right] \\
= \frac{a^b}{48} \left[ \frac{67\sqrt{2}}{48} + \frac{5}{16} \log \left( \sqrt{2} + 1 \right) \right] \\
= \frac{a^b}{48} \left[ 67\sqrt{2} + 15 \log \left( \sqrt{2} + 1 \right) \right] \]

Practice example

\[ \int_{0}^{5} \frac{\tan^{-1}(x-[x])}{1 + (x-[x])^2} \, dx \], where \([ \cdot ]\) denotes the greatest integer function, is equal to

(a) \(\frac{\pi^2}{32}\)  
(b) \(\frac{3\pi^2}{32}\)
(c) \(\frac{5\pi^2}{32}\)  
(d) none of these

Solution:

\[ \int_{0}^{5} \frac{\tan^{-1}(x-[x])}{1 + (x-[x])^2} \, dx \\
= \int_{0}^{5} \frac{\tan^{-1}(x-[x])}{1 + (x-[x])^2} \, dx \\
= \int_{0}^{1} \frac{\tan^{-1} x}{1 + x^2} \, dx + \int_{1}^{2} \frac{\tan^{-1} (x-1)}{1 + (x-1)^2} \, dx + \cdots \]
Practice example

Let \( I_1 = \int x f(x(3 - x)) \, dx \) \sec^2 x

and, \( I_2 = \int f(x(3 - x)) \, dx \) \sec^2 x

where \( f \) is a continuous function and \( x \) is any real number, then \( I_1/I_2 = \)

(a) \( \frac{3}{2} \)       (b) \( \frac{1}{2} \)

(c) 1         (d) none of these
Solution

(a). We have, \[ I_1 = \int_{\sec^2 z}^{2 - \tan^2 z} f(x (3 - x)) \, dx \]

\[ = \int_{\sec^2 z}^{2 - \tan^2 z} (3 - x) \, f((3 - x) (3 - (3 - x))) \, dx \]

\[ = \int_{\sec^2 z}^{2 - \tan^2 z} \left[ \int_{a}^{b} f(x) \, dx = \int_{a}^{b} f(a + b - x) \, dx \right] \]

\[ = \int_{\sec^2 z}^{2 - \tan^2 z} f(x (3 - x)) \, dx \]

\[ = 3 \int_{\sec^2 z}^{2 - \tan^2 z} f(x (3 - x)) \, dx - \int_{\sec^2 z}^{2 - \tan^2 z} x \cdot f(x (3 - x)) \, dx \]

\[ = 3 I_2 - I_1 \]

\[ \therefore 2 I_1 = 3 I_2 \text{ and so } I_1/I_2 = \frac{3}{2} \]

Practice example

Evaluate \[ \int_{0}^{\frac{\pi}{2}} \tan^3 \theta \, d\theta \]

\[ I = \int_{0}^{\frac{\pi}{2}} \tan^3 \theta \, d\theta \]
\[
\begin{align*}
&= \left( \frac{\tan^4 \theta}{4} \right)_{0}^{\frac{\pi}{4}} - \int_{0}^{\frac{\pi}{4}} \tan^3 \theta \, d\theta \\
&= \frac{1}{4} - \int_{0}^{\frac{\pi}{4}} \tan^3 \theta \, d\theta \\
&= \frac{1}{4} \left[ \left( \frac{\tan^2 \theta}{2} \right)_{0}^{\frac{\pi}{4}} - \int_{0}^{\frac{\pi}{4}} \tan \theta \, d\theta \right] \\
&= \frac{1}{4} \left[ \frac{1}{2} - (\log \sec \theta)_{0}^{\frac{\pi}{4}} \right] \\
&= \frac{1}{4} \left[ \frac{1}{2} - \log \sqrt{2} \right] \\
&= \frac{1}{4} + \log \sqrt{2} \\
&= \frac{1}{4} + \frac{1}{2} \log 2 \\
\end{align*}
\]

Practice example

If \( \varphi (n) = \int_{0}^{\frac{\pi}{4}} \tan^n x \, dx \), show that \( \varphi (n) + \varphi (n - 2) \)

\[= \frac{1}{n - 1} \] and deduce the value of \( \varphi (5) \).
Solution:

\[ \varphi(n) = \int_0^{\frac{\pi}{2}} \tan^n x \, dx \]
\[ = \left( \frac{\tan^{n-1} x}{n-1} \right)_{\frac{\pi}{2}}^{\frac{\pi}{4}} - \int_0^{\frac{\pi}{4}} \tan^{n-2} x \, dx \]
\[ = \frac{1}{n-1} - \varphi_{n-2} \]

\[ \Rightarrow \varphi_n + \varphi_{n-2} = \frac{1}{n-1} \quad \text{Proved} \]

Now \( \varphi(5) = \frac{1}{4} - \varphi_3 \)
\[ = \frac{1}{4} - \left[ \frac{1}{2} - \varphi_1 \right] \]
\[ = \frac{1}{4} + \varphi_1 \]
\[ = \frac{1}{4} + \int_0^{\frac{\pi}{2}} \tan x \, dx \]

Practice Example

Prove that
\[ \int_0^{\frac{\pi}{2}} \cos^m x \sin mx \, dx = \frac{1}{2^{m+1}} \left\{ \frac{2^2}{2} + \frac{2^3}{3} + \ldots + \frac{2^m}{m} \right\} \]

Solution:

We know that
\[ \int_0^{\frac{\pi}{2}} \cos^m x \sin mx \, dx \]
\[ = \left[ -\cos^m x \cos mx \right]_{0}^{\frac{\pi}{2}} + \frac{m}{m+m} \int_0^{\frac{\pi}{2}} \cos^{m-1} x \sin (m-1) x \, dx \]

\[ \Rightarrow \quad I_{m,m} = \frac{1}{2m} + \frac{1}{2} I_{m-1,m-1} \]

Put \( m-1 \) for \( m \),
\[ I_{m-1,m-1} = \frac{1}{2(m-1)} + \frac{1}{2} I_{m-2,m-2} \]
\[ I_{n,m} = \frac{1}{2m} + \frac{1}{2} \left[ \frac{1}{2(m-1)} + \frac{1}{2} I_{m-2,n-2} \right] \]

\[ = \frac{1}{2m} + \frac{1}{2} \left( \frac{1}{2(m-1)} + \frac{1}{2} I_{m-2,n-2} \right) \]

\[ = \frac{1}{2m} + \frac{1}{2} \left( \frac{1}{2(m-1)} + \frac{1}{2} \left( \frac{1}{2(m-2)} + \frac{1}{2} I_{m-3,n-3} \right) \right) \]

\[ \text{Proceeding similarly} \]

\[ = \frac{1}{2m} + \frac{1}{2} \left( \frac{1}{2(m-1)} + \frac{1}{2} \left( \frac{1}{2(m-2)} + \frac{1}{2} \left( \frac{1}{2(m-3)} + \frac{1}{2} I_{m-4,n-4} \right) \right) \right) \]

\[ \cdots \]

\[ + \frac{1}{2^m} \left( \frac{1}{2(m-n-1)} \right) + \frac{1}{2^m} I_{m-n,n-n} \]

\[ = \frac{1}{2m} + \frac{1}{2^2} \left( \frac{1}{m-1} \right) + \frac{1}{2^3} \left( \frac{1}{m-2} \right) + \frac{1}{2^4} \left( \frac{1}{m-3} \right) \]

\[ \cdots + \frac{1}{2^n} + \frac{1}{2^n} I_{m-n,n} \]

\[ = \frac{1}{2m} + \frac{1}{2^2} \left( \frac{1}{m-1} \right) + \frac{1}{2^3} \left( \frac{1}{m-2} \right) + \frac{1}{2^4} \left( \frac{1}{m-3} \right) \]

\[ \cdots + \frac{1}{2^m} + \frac{1}{2^m} \int_0^{\infty} \theta \, d\theta \]

Now \( \int_0^{\infty} \theta \, d\theta = [e]_0^{\infty} = e - e = 0 \)

\[ \therefore I_{n,m} = \frac{1}{2m} + \frac{1}{2^2} \left( \frac{1}{m-1} \right) + \frac{1}{2^3} \left( \frac{1}{m-2} \right) + \frac{1}{2^4} \left( \frac{1}{m-3} \right) + \frac{1}{2^m} + \frac{1}{2^m} \int_0^{\infty} \theta \, d\theta \]

Writing the series in the reverse order

\[ = \frac{1}{2^m} + \frac{1}{2^{m-1}} \cdot 2 + \frac{1}{2^{m-2}} \cdot 3 + \frac{1}{2^m} \cdot 1 \]

\[ = \frac{1}{2^m} \left[ \frac{2^m+1}{2^m-1} + \frac{2^m+1}{2^m-2} \cdot 2 + \frac{2^m+1}{2^m-3} \cdot 3 + \cdots + \frac{2^m+1}{2^m-1} \right] \]
Practice Example

Prove that \( \int_{0}^{\frac{\pi}{2}} \cos^{n-2} x \sin nx \, dx = \frac{1}{n-1} \); \( n \) being an integer greater than unity.

Solution:

\[
I = \int_{0}^{\frac{\pi}{2}} \cos^{n-2} x \sin nx \, dx
\]

\[
= \int_{0}^{\frac{\pi}{2}} \cos^{n-2} x \sin \left( (n-1)x + x \right) \, dx
\]

\[
= \int_{0}^{\frac{\pi}{2}} \cos^{n-2} x \left( \sin (n-1)x \cos x + \cos (n-1)x \sin x \right) \, dx
\]

\[
= \int_{0}^{\frac{\pi}{2}} \cos^{n-1} x \, dx - \frac{1}{n-1} \int_{0}^{\frac{\pi}{2}} \cos^{n-2} x \cos (n-1)x \sin x \, dx
\]

Integrating the first integral only by parts

\[
= \left\{ \cos^{n-2} x - \frac{\cos (n-1)x}{n-1} \right\} \bigg|_{0}^{\frac{\pi}{2}}
\]

\[
- \frac{\pi}{2} \left( (n-1) \cos^{n-2} x (-\sin x) \cdot \left\{ \frac{\cos (n-1)x}{n-1} \right\} \, dx
\]

\[
+ \int_{0}^{\frac{\pi}{2}} \cos^{n-2} x \cos (n-1)x \sin x \, dx
\]

\[
= \frac{1}{n-1} - \int_{0}^{\frac{\pi}{2}} \cos^{n-2} x \cos (n-1)x \sin x \, dx
\]

\[
+ \int_{0}^{\frac{\pi}{2}} \cos^{n-2} x \cos (n-1)x \sin x \, dx
\]

\[
= \frac{1}{n-1}
\]
Practice Example

If \( I_{1,n} = \int_{0}^{\pi/2} \frac{\sin(2n-1)x}{\sin x} \, dx \) and \( I_{2,n} = \int_{0}^{\pi/2} \frac{\sin^2 nx}{\sin^2 x} \, dx \)

\( n \in \mathbb{N} \), then

(a) \( I_{2,n+1} - I_{2,n} = I_{1,n} \)
(b) \( I_{2,n+1} - I_{2,n} = I_{1,n+1} \)
(c) \( I_{2,n+1} + I_{1,n} = I_{2,n} \)
(d) \( I_{2,n+1} + I_{1,n+1} = I_{2,n} \)

Solution

\[ (b.) \quad I_{2,n} - I_{2,n-1} = \int_{0}^{\pi/2} \frac{(\sin^2 nx - \sin^2 (n-1)x)}{\sin^2 x} \, dx \]

\[ = \int_{0}^{\pi/2} \frac{\sin (2n-1)x \sin x}{\sin^2 x} \, dx \]

\[ = \int_{0}^{\pi/2} \frac{\sin (2n-1)x}{\sin x} \, dx = I_{1,n} \]

\( \therefore \quad I_{2,n+1} - I_{2,n} = I_{1,n+1} \)
Reduction forms

Let \( I_n = \int \sin^n x \, dx \) or \( I_n = \int \sin^{n-1} x \sin x \, dx \).

Integrating by parts regarding \( \sin x \) as the 2nd function, we have
\[
I_n = \sin^{n-1} x \cos x \big( \cos x \big) - \int (n-1) \sin^{n-2} x \cos x \cos x \, dx
\]
\[
= -\sin^{n-1} x \cos x + (n-1) \int \sin^{n-2} x \cos^2 x \, dx
\]
\[
= -\sin^{n-1} x \cos x + (n-1) \int \sin^{n-2} x (1 - \sin^2 x) \, dx
\]
\[
= -\sin^{n-1} x \cos x + (n-1) \int \sin^{n-2} x \, dx - (n-1) \int \sin^n x \, dx
\]
\[
= -\sin^{n-1} x \cos x + (n-1) \int \sin^{n-2} x \, dx - (n-1) I_n
\]

Transposing the last term to the left, we have
\[
I_n (1 + n - 1) = -\sin^{n-1} x \cos x + (n-1) I_{n-2}
\]
\[
\int \sin^{n-2} x \, dx = \int \sin^n x \, dx
\]
or
\[
\int \sin^{n-1} x \cos x \, dx = \int \sin^n x \, dx
\]

Let \( I_n = \int \cos^n x \, dx \) or \( I_n = \int \cos^{n-1} x \cos x \, dx \).

Integrating by parts regarding \( \cos x \) as the 2nd function, we have
\[
I_n = \cos^{n-1} x \sin x - \int (n-1) \cos^{n-2} x \sin x \sin x \, dx
\]
\[
= \cos^{n-1} x \sin x + (n+1) \int \cos^{n-2} x \sin^2 x \, dx
\]
\[
= \cos^{n-1} x \sin x + (n-1) \int \cos^{n-2} x (1 - \cos^2 x) \, dx
\]
\[
= \cos^{n-1} x \sin x + (n-1) \int \cos^{n-2} x \, dx - (n-1) \int \cos^n x \, dx
\]
\[
= \cos^{n-1} x \sin x + (n-1) I_{n-2} - (n-1) I_n
\]

Transposing the last term to the left, we have
\[
I_n (1 + n - 1) = \cos^{n-1} x \sin x + (n-1) I_{n-2}
\]
or
\[
I_n = \cos^{n-1} x \sin x + (n-1) I_{n-2}
\]
\[
\int \cos^n x \, dx = \frac{\cos^{n-1} x \sin x}{n} + \frac{n-1}{n} \int \cos^{n-2} x \, dx
\]
We have $\int \tan^n x \, dx = \int \tan^{n-2} x \cdot \tan^2 x \, dx$

$= \int \tan^{n-2} x \cdot (\sec^2 x - 1) \, dx$

$= \int \tan^{n-2} x \cdot \sec^2 x \, dx - \int \tan^{n-2} x \, dx$

$= \frac{(\tan x)^{n-2+1}}{n-2+1} - \int \tan^{n-2} x \, dx$

or $\int \tan^n x \, dx = \frac{\tan^{n-1} x}{n-1} - \int \tan^{n-2} x \, dx,$

We have $\int \cot^n x \, dx = \int \cot^{n-2} x \cdot \cot^2 x \, dx$

$= \int \cot^{n-2} x \cdot (\csc^2 x - 1) \, dx$

$= \int \cot^{n-2} x \cdot \csc^2 x \, dx - \int \cot^{n-2} x \, dx$

$= -\frac{(\cot x)^{n-1}}{n-1} - \int \cot^{n-2} x \, dx$

or $\cot^n x \, dx = -\frac{\cot^{n-1} x}{n-1} - \int \cot^{n-2} x \, dx,$

We have $I_n = \int \sec^n x \, dx = \int \sec^{n-2} x \cdot \sec^2 x \, dx$

Integrating by parts regarding $\sec^2 x$ as the 2nd function, we have

$I_n = \sec^{n-2} x \cdot \tan x - \int (n-2) \sec^{n-3} x \cdot \sec x \cdot \tan^2 x \, dx$

$= \sec^{n-2} x \cdot \tan x - (n-2) \int \sec^{n-2} x \cdot (\sec^2 x - 1) \, dx$

$= \sec^{n-2} x \cdot \tan x - (n-2) \int \sec^n x \, dx + (n+2) \int \sec^{n-2} x \, dx$.

Transposing the term containing $\int \sec^n x \, dx$ to the left, we have

$(n-2+1) \int \sec^n x \, dx = \sec^{n-2} x \cdot \tan x + (n-2) \int \sec^{n-2} x \, dx$
\[ \int \sec^2 x \, dx = \sec^2 x \tan x - \int (n - 2) \sec^{n-2} x \tan x \, dx \]
\[ = \tan x \sec^{n-2} x - (n - 2) \int \sec^{n-2} x (\sec^2 x - 1) \, dx \]
\[ = \tan x \sec^{n-2} x - (n - 2) \left( \sec^x x - \int \sec^{n-2} x \, dx \right) \]
\[ [1 + (n - 2)] \int \sec^x x \, dx = \tan x \sec^{n-2} x + (n - 2) \int \sec^{n-2} x \, dx \]
\[ \int \sec^x x \, dx = \frac{\tan x \sec^{n-2} x}{n - 1} + \frac{n - 2}{n - 1} \int \sec^{n-2} x \, dx \]

### Some series Expansions -

\[
\frac{\pi}{2} = \left(\frac{2}{1}\right)\left(\frac{2}{3}\right)\left(\frac{4}{5}\right)\left(\frac{4}{6}\right)\left(\frac{6}{5}\right)\left(\frac{6}{7}\right)\left(\frac{8}{7}\right)\left(\frac{8}{9}\right)\ldots
\]
\[ n = \frac{4}{1} - \frac{4}{3} + \frac{4}{5} - \frac{4}{7} + \frac{4}{9} - \frac{4}{11} + \frac{4}{13} - \cdots \]

\[ \frac{\pi}{4} = \frac{1}{1} - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \cdots \]

\[ \pi = \sqrt{12} \left( 1 - \frac{1}{3^2} + \frac{1}{5^2} - \frac{1}{7^2} + \cdots \right) \]

\[ \frac{\pi^2}{6} = \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \frac{1}{5^2} + \cdots = \sum_{n=1}^{\infty} \frac{1}{n^2} \]

\[ \int_0^\pi \log x \, dx = -\frac{\pi^2}{2} \log 2 = \frac{\pi^2}{2} \log \frac{1}{2} \]

Solve a series problem

If \( \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots \) up to \( \infty \), then value of

\( \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \cdots \) up to \( \infty \) is

(a) \( \frac{\pi^2}{4} \)
(b) \( \frac{\pi^2}{6} \)
(c) \( \frac{\pi^2}{8} \)
(d) \( \frac{\pi^2}{12} \)

Ans. (c)

Solution

We have

\[ \frac{1}{1^2} + \frac{1}{3^2} + \frac{1}{5^2} + \cdots \] up to \( \infty \)

\[ = \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \frac{1}{5^2} + \frac{1}{6^2} + \cdots \] up to \( \infty \)

\[ - \frac{1}{2^2} \left[ 1 + \frac{1}{2^2} + \frac{1}{3^2} + \cdots \right] \]

\[ = \frac{\pi^2}{6} - \frac{1}{4} \left( \frac{\pi^2}{6} \right) = \frac{\pi^2}{8} \]

\[ 1 - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \frac{1}{5^2} - \frac{1}{6^2} + \cdots = \frac{\pi^2}{12} \]

\[ \frac{1}{2^2} + \frac{1}{4^2} + \frac{1}{6^2} + \cdots = \frac{\pi^2}{24} \]
\[
\sin \sqrt{x} = 1 - \frac{x}{3!} + \frac{x^3}{5!} - \frac{x^5}{7!} + \frac{x^7}{9!} - \frac{x^9}{11!} + \ldots
\]

\[
\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \ldots = \sum_{k=0}^{n} \frac{(-1)^k x^{2k}}{(2k)!}
\]

\[
\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \ldots = \sum_{k=0}^{n} \frac{(-1)^k x^{2k+1}}{(2k+1)!}
\]

\[
\cosh x = 1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \ldots = \sum_{k=0}^{n} \frac{x^{2k}}{(2k)!}
\]

\[
\sinh x = x + \frac{x^3}{3!} + \frac{x^5}{5!} + \ldots = \sum_{k=0}^{n} \frac{x^{2k+1}}{(2k+1)!}
\]

\[
\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \ldots \quad (-1 \leq x < 1)
\]

\[
\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \frac{17x^7}{315} + \frac{62x^9}{2835} + \ldots + \frac{2^{2n}(2^{2n}-1)B_{2n}x^{2n-1}}{(2n)!} + \ldots \quad |x| < \frac{\pi}{2}
\]

\[
\sec x = 1 + \frac{x^2}{2} + \frac{5x^4}{24} + \frac{61x^6}{720} + \ldots + \frac{B_{2n}x^{2n}}{(2n)!} + \ldots \quad |x| < \frac{\pi}{2}
\]

\[
\csc x = \frac{1}{x} + \frac{x^3}{6} + \frac{7x^5}{360} + \frac{31x^7}{15120} + \ldots + \frac{2^{2n-1}(2^{2n}-1)B_{2n}x^{2n-1}}{(2n)!} + \ldots \quad 0 < |x| < \pi
\]

\[
\cot x = \frac{1}{x} - \frac{x^3}{3} - \frac{2x^5}{45} - \frac{2^2B_{2n-1}x^{2n-1}}{(2n)!} - \ldots \quad 0 < |x| < \pi
\]
\[ \tan x = x + \frac{x^3}{3} + \frac{2}{15} x^5 + \cdots \]
\[ \sec x = 1 + \frac{x^2}{2} + \frac{5}{4} x^4 + \cdots \]
\[ \log (\cos x) = -\frac{x^2}{2} - \frac{2}{4} x^4 + \cdots \]
\[ \log (1 + \sin x) = x - \frac{x^2}{2} + \frac{x^3}{6} - \frac{x^4}{12} + \cdots \]

\[ \sin^{-1} x = x + \frac{1}{2} \frac{x^3}{3} + \frac{1 \cdot 3}{2 \cdot 4} x^5 + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} x^7 + \cdots \quad |x| < 1 \]

\[ \cos^{-1} x = \frac{\pi}{2} - \sin^{-1} x \]
\[ = \frac{\pi}{2} \left( x + \frac{1}{2} \frac{x^3}{3} + \frac{1 \cdot 3}{2 \cdot 4} x^5 + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6} x^7 + \cdots \right) \quad |x| < 1 \]

\[ \tan^{-1} x = \begin{cases} 
\quad x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots \quad |x| < 1 \\
\pm \frac{\pi}{2} - \frac{1}{x} + \frac{1}{3x^3} - \frac{1}{5x^5} + \cdots \quad \begin{cases} + & \text{if } x \geq 1 \\
- & \text{if } x \leq -1 \end{cases} 
\end{cases} \]

\[ \sec^{-1} x = \cos^{-1} \left( \frac{1}{x} \right) \]
\[ = \frac{\pi}{2} \left( \frac{1}{x} + \frac{1}{2} \frac{1}{2 \cdot 3x^3} + \frac{1 \cdot 3}{2 \cdot 4 \cdot 5x^5} + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6 \cdot 7x^7} + \cdots \right) \quad |x| > 1 \]

\[ \csc^{-1} x = \sin^{-1} \left( \frac{1}{x} \right) \]
\[ = \frac{1}{x} + \frac{1}{2 \cdot 3x^3} + \frac{1 \cdot 3}{2 \cdot 4 \cdot 5x^5} + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6 \cdot 7x^7} + \cdots \quad |x| > 1 \]

\[ \cot^{-1} x = \frac{\pi}{2} - \tan^{-1} x \]
\[ = \begin{cases} 
\quad x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots \quad |x| < 1 \\
\quad px + \frac{1}{3x^3} + \frac{1}{5x^5} + \cdots \quad \begin{cases} p = 0 & \text{if } x \geq 1 \\
q = 1 & \text{if } x \leq -1 \end{cases} 
\end{cases} \]
\[ e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \ldots = \sum_{n=0}^{\infty} \frac{x^n}{n!} \]

\[ \ln x = 2 \left[ \frac{x-1}{x+1} + \frac{1}{3} \left( \frac{x-1}{x+1} \right)^3 + \frac{1}{5} \left( \frac{x-1}{x+1} \right)^5 + \ldots \right] 
= 2 \sum_{n=1}^{\infty} \frac{1}{2n-1} \left( \frac{x-1}{x+1} \right)^{2n-1} \quad (x > 0) \]

\[ \ln x = -\frac{x-1}{x} + \frac{1}{2} \left( \frac{x-1}{x} \right)^2 + \frac{1}{3} \left( \frac{x-1}{x} \right)^3 + \ldots 
= \sum_{n=1}^{\infty} \frac{1}{n} \left( \frac{x-1}{x} \right)^n \quad (x > \frac{1}{2}) \]

\[ \ln x = (x-1) - \frac{1}{2} (x-1)^2 + \frac{1}{3} (x-1)^3 - \ldots 
= \sum_{n=1}^{\infty} (-1)^{n-1} \frac{1}{n} (x-1)^n \quad (0 < x \leq 2) \]

\[ \ln (1+x) = -\frac{1}{2} x^2 + \frac{1}{3} x^3 - \ldots 
= \sum_{n=1}^{\infty} (-1)^{n-1} \frac{1}{n} x^n \quad (|x| < 1) \]

\[ \log_e (1-x) = -x - \frac{x^2}{2} - \frac{x^3}{3} - \frac{x^4}{4} - \ldots \infty (-1 \leq x < 1) \]

\[ \log_e (1+x) - \log_e (1-x) = \] 

\[ \log_e (1+x) = 2 \left( x + \frac{x^3}{3} + \frac{x^5}{5} + \ldots \infty \right) (-1 < x < 1) \]

\[ \log_e \left( \frac{1+x}{1-x} \right) = \log_e \frac{x+1}{x} = 2 \left[ \frac{1}{2x+1} + \frac{1}{3(2x+1)^3} + \frac{1}{5(2x+1)^5} + \ldots \infty \right] \]

\[ \log_e (1+x) + \log_e (1-x) = \log_e (1-x^2) = -2 \left( \frac{x^2}{2} + \frac{x^4}{4} + \ldots \infty \right) (-1 < x < 1) \]

\[ \log 2 = -\frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \ldots = \frac{1}{1.2} + \frac{1}{3.4} + \frac{1}{5.6} + \ldots \]
Important Results

(i) \[ \int_0^{\pi/2} \frac{\sin^n x}{\sin^n x + \cos^n x} \, dx = \frac{\pi}{4} \int_0^{\pi/2} \frac{\cos^n x}{\sin^n x + \cos^n x} \, dx \]

(b) \[ \int_0^{\pi/2} \frac{\tan^n x}{1 + \tan^n x} \, dx = \frac{\pi}{4} \int_0^{\pi/2} \frac{dx}{1 + \tan^n x} \]

(c) \[ \int_0^{\pi/2} \frac{dx}{1 + \cot^n x} = \frac{\pi}{4} \int_0^{\pi/2} \frac{\cot^n x}{1 + \cot^n x} \, dx \]

(d) \[ \int_0^{\pi/2} \frac{\cot^n x}{\tan^n x + \cot^n x} \, dx = \frac{\pi}{4} \int_0^{\pi/2} \frac{\tan^n x}{\cot^n x + \tan^n x} \, dx \]

(e) \[ \int_0^{\pi/2} \frac{\csc^n x}{\sec^n x + \csc^n x} \, dx = \frac{\pi}{4} \int_0^{\pi/2} \frac{\sec^n x}{\csc^n x + \sec^n x} \, dx \] where \( n \in \mathbb{R} \)

(ii) \[ \int_0^{\pi/2} \frac{a^n \sin^n x}{a^n \sin^n x + a^n \cos^n x} \, dx = \int_0^{\pi/2} \frac{a \cos^n x}{a \sin^n x + a \cos^n x} \, dx = \frac{\pi}{4} \]

(iii) \[ \int_0^{\pi/2} \log \sin x \, dx = \int_0^{\pi/2} \log \cos x \, dx = -\frac{\pi}{2} \log 2 \]

(b) \[ \int_0^{\pi/2} \log \tan x \, dx = \int_0^{\pi/2} \log \cot x \, dx = 0 \]

(c) \[ \int_0^{\pi/2} \log \sec x \, dx = \int_0^{\pi/2} \log \csc x \, dx = \frac{\pi}{2} \log 2 \]

(iv) \[ \int_0^\infty e^{-ax} \sin bx \, dx = \frac{b}{a^2 + b^2} \]

(b) \[ \int_0^\infty e^{-ax} \cos bx \, dx = \frac{a}{a^2 + b^2} \]

(c) \[ \int_0^\infty e^{-ax} x^n \, dx = \frac{n!}{a^n + 1} \]
\[
\begin{align*}
\int \frac{dx}{\sqrt{x^2 - a^2}} &= \ln\left(x + \sqrt{x^2 - a^2}\right) + C \\
\int \frac{dx}{\sqrt{x^2 + a^2}} &= \ln\left(x + \sqrt{x^2 + a^2}\right) + C \\
\int \frac{dx}{x^2 - a^2} &= \frac{1}{2a} \ln\left(\frac{x-a}{x+a}\right) + C \\
\int \frac{dx}{a^2 - x^2} &= \frac{1}{2a} \ln\left(\frac{a+x}{a-x}\right) + C \\
\int \sqrt{a^2 - x^2} \, dx &= \frac{x}{2} \sqrt{a^2 - x^2} + \frac{a^2}{2} \sin^{-1}\left(\frac{x}{a}\right) + C \\
\int \sqrt{a^2 + x^2} \, dx &= \frac{x}{2} \sqrt{a^2 + x^2} + \frac{a^2}{2} \sinh^{-1}\left(\frac{x}{a}\right) + C \\
\int \sqrt{x^2 - a^2} \, dx &= \frac{x}{2} \sqrt{x^2 - a^2} - \frac{a^2}{2} \cosh^{-1}\left(\frac{x}{a}\right) + C
\end{align*}
\]
